<b>Component/ System</b>	<b>Fault Code</b>	<b>Monitor Description</b>	<b>Malfunction Criteria</b>	<b>Threshold Value</b>	<b>Secondary Parameters</b>	<b>Enable Conditions</b>	<b>Time Required</b>	<b>MIL Illum.</b>
MAP / MAF / Throttle Position Correlation	P0068	Detect when MAP and MAF do not match estimated engine airflow as established by the TPS	<p>Difference between MAP and estimated MAP exceeds threshold (kPa), or P0651 (5 Volt Ref), or P0107 (MAP circuit low), or P0108 (MAP circuit high) have failed this key cycle, then MAP portion of diagnostic fails</p> <p>Absolute difference between MAF and estimated MAF exceed threshold (grams/sec), or P0102 (MAF circuit low), or P0103 (MAF circuit hi) have failed this key cycle, or maximum MAF versus RPM (Table) is greater than or equal to maximum MAF versus battery voltage, then MAF portion of diagnostic fails</p>	<p>Table, f(TPS). See supporting tables: <b>P0068_Delta MAP Threshold f(TPS)</b></p> <p>Table, f(TPS). See supporting tables: <b>P0068_Delta MAF Threshold f(TPS)</b></p> <p>Table, f(RPM). See supporting tables: <b>P0068_Maximum MAF f(RPM)</b></p> <p>Table, f(Volts). See supporting tables: <b>P0068_Maximum MAF f(Volts)</b></p>	Engine Speed	<p>&gt; 8,192 RPM</p> <p>Run/Crank voltage &gt; 6.41</p>	<p>Continuously fail MAP and MAF portions of diagnostic for 0.1875 s</p> <p>Continuous in MAIN processor</p>	Type A, 1 Trips

**16 OBDG02 ECM Summary Tables (Initial DTCs)**

Component/System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Outside Air Temperature (OAT) Sensor Circuit Performance (OAT wired to ECM)	P0071	Detects an OAT sensor that has stuck in range by comparing to IAT when conditions are appropriate	OAT-to-IAT engine off equilibrium counter	>= 300.0 counts	Time between current ignition cycle and the last time the engine was running	>= 28,800.0 seconds	Executed every 100 msec	Type B, 2 Trips
			(see below for description of this counter)			Engine is not running		
			If IAT >= OAT: IAT - OAT	> 15.0 deg C	Vehicle Speed	>= 12.4 MPH		
			If IAT < OAT: OAT - IAT	> 15.0 deg C	Coolant Temperature - IAT	< 15.0 deg C		
			The "OAT-to-IAT engine off equilibrium counter" is a counter that is incremented or decremented based on vehicle speed when the engine is off. When this counter is high enough, the vehicle has reached an equilibrium where IAT and OAT can be compared. The value that is added or subtracted to the counter every 100 msec is contained in table <b>P0071: OAT Performance Drive Equilibrium Engine Off</b>		IAT - Coolant Temperature	< 15.0 deg C		
					No Active DTCs:	VehicleSpeedSensor_FA IAT_SensorFA ECT_Sensor_DefaultDetected MAF_SensorFA EngineModeNotRunTimer Error		
			OAT-to-IAT engine running equilibrium counter	>= 300.0 counts	Engine is running		Executed every 100 msec	
			(see below for description of this counter)		Vehicle Speed	>= 12.4 MPH		
			If IAT >= OAT: IAT - OAT	> 15.0 deg C	Engine air flow	>= 10.0 grams/second		
			If IAT < OAT:		No Active DTCs:	VehicleSpeedSensor_FA IAT_SensorFA ECT_Sensor_DefaultDetected MAF_SensorFA

Engine Coolant Temp Sensor Circuit High	P0118	Circuit Continuity This DTC detects a short to high or open in the ECT signal circuit or the ECT sensor.	ECT Resistance (@ -60°C)	> 260,000 Ohms	Engine run time OR IAT min	> 15.0 seconds  ≥ -7.0 °C	5 failures out of 6 samples  1 sec/ sample  Continuous	Type B, 2 Trips

**16 OBDG02 ECM Summary Tables (Initial DTCs)**

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Engine Coolant Temperature (ECT) Sensor Circuit Intermittent	P0119	Circuit Continuity This DTC detects large step changes in the ECT signal circuit or the ECT sensor. Allowable high and low limits are calculated for the next sample based on the previous sample.	ECT temperature step change:  1) positive step change is greater than calculated high limit  OR  2) negative step change is lower than calculated low limit.  The calculated high and low limits for the next reading use the following calibrations: 1) Sensor time constant 2) Sensor low limit 3) Sensor high limit  *****Generic Example*****  If the last ECT reading was 90 Deg C, the Time constant was calibrated at 10 seconds, the low limit was calibrated to -80 Deg C and the high limit was calibrated to 200 Deg C the calculated limits are 101 Deg C and 73 Deg C.  The next reading (after the 90 Deg C reading) must be between 73 Deg C and 101 Deg C to be valid.	15.0 seconds -60.0 Deg C 150.0 Deg C	No Active DTC's	ECT_Sensor_Ckt_FP	3 failures out of 4 samples  1 sec/ sample  Continuous	Type B, 2 Trips

### 16 OBDG02 ECM Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.	
Random Misfire Detected	P0300	These DTC's will determine if a random or a cylinder specific misfire is occurring by monitoring various terms derived from crankshaft velocity. The rate of misfire over an interval is compared to both emissions and catalyst damaging thresholds. The pattern of crankshaft acceleration after the misfire is checked to differentiate between real misfire and other sources of crank shaft noise.	Crankshaft Deceleration Value(s) vs. Engine Speed and Engine load  The equation used to calculate deceleration value is tailored to specific vehicle operating conditions. The selection of the equation used is based on the 1st single cylinder continuous misfire threshold tables encountered that are not max of range. If all tables are max of range at a given speed/load, that speed load region is an <b>Undetectable region</b> see Algorithm Description Document for additional details.  SINGLE CYLINDER CONTINUOUS MISFIRE(	- see details of thresholds on Supporting Tables Tab	Engine Run Time  Engine Coolant Temp Or If ECT at startup Then ECT  System Voltage + Throttle delta - Throttle delta          Early Termination option: (used on plug ins that may not have enough engine run time at end of trip for normal interval to complete.)	> 2 crankshaft revolution  -10 °C < ECT < 125 °C < -10 °C 21 °C < ECT < 125 °C  9.00 < volts < 32.00 < 100.00 % per 25 ms < 100.00 % per 25 ms          Not Enabled	Emission Exceedence = any ( 5 ) failed 200 rev blocks out of ( 16 ) 200 rev block tests  Failure reported for ( 1 ) Exceedence in 1st ( 16 ) 200 rev block tests, or ( 4 ) Exceedences thereafter. 16 OBDG02 ECM Summary Tables (Initial DTCs)

Component/System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Exhaust Gas Recirculation (EGR) Flow Insufficient	P0401	During a closed throttle decel condition, the EGR valve is normally closed. This diagnostic opens the valve to a pre-determined position, and the change in MAP is computed. This change in MAP correlates to the flow rate of the EGR system	With EGR valve open, the peak positive MAP change is monitored over a period of time. This value is compared with a threshold from an Engine Speed vs Baro table and the difference computed. The result is statistically filtered (EWMA) and compared to a decision limit.	DTC is set when the filtered pressure change (NeEGRD_p_EWMA) exceeds 2.40	Run multiple tests ( <b>P0401_StepSamplesPer Trip</b> ) IF the difference between the current EWMA and the current map diff > ( <b>P0401_StepDelta</b> ) AND current map diff > ( <b>P0401_StepMAP_DIFF</b> ) until ( <b>P0401_SamplesAfterStep</b> ) number of tests have been completed. Initiate multiple tests upon code clear or a non-volatile memory failure: Several tests per trip will run until ( <b>P0401_SamplesAfterReset</b> ) # of tests have been completed.	EGR is available,  DTC's NOT active: FuelInjectorCircuit_FA CrankSensor_FA TPS_Performance_FA TPS_FAMAP_SensorFA VehicleSpeedSensor_FA 5VoltReferenceA_FA 5VoltReferenceB_FA IAT_SensorFA ECT_Sensor_Ckt_FA IAC_SystemRPM_FA EGRValveCircuit_FA EngineMetalOvertempActive  Not in Power Take Off (PTO) Mode, Traction control is NOT active, Not in device control, Not in Catalyst protection mode  DTC's NOT active:  P0604 EngineMisfireDetected_FA MAF_SensorFA, , Ethanol Composition Sensor FA Difference between desired & actual Air Charge < 15.00 ,  BARO > 70.00 & NOT defaulted, -5.00 < IAT < 100.00 ,  , Trans gear stable timer >	Time to test (once enabled) = 0.50 sec.  Completes once per trip (typically) 6.25 ms operating loop	Type A, 1 Trips

**16 OBDG02 ECM Summary Tables (Initial DTCs)**

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
EVAP System Small Leak Detected  (ELCP Vented Fuel System)	P0442	A small leak ( $\geq 0.020$ "") is detected in the EVAP system between the fuel cap and purge solenoid. The ELCP vacuum pump creates a vacuum across a 0.020" reference orifice. This reference vacuum is then compared to the vacuum level created in the fuel tank to determine if a leak exists.	If the ELCP pressure sensor (gauge) vacuum reading is less than the 2nd 0.020" reference orifice vacuum measurement for then the fuel tank system has a small leak and the DTC fails.	1,000 seconds	Propulsion system not active time  Distance since assembly plant Drive distance Min baro Max baro Min fuel level Max fuel level ECT Min IAT Max IAT Time since last test when passing P0442/P0455 Time since last test when failing P0442/P0455 ***** ELCP hardware can be powered by battery or powertrain relay. Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Control Module Read Only Memory (ROM)	P0601	This DTC will be stored if the calibration check sum is incorrect or the flash memory detects an uncorrectable error via the Error Correcting Code.	The Primary Processor's calculated checksum does not match the stored checksum value. Covers all software and calibrations.	1 failure if the fault is detected during the first pass. 5 failures if the fault occurs after the first pass is complete.			Diagnostic runs continuously in the background.	Type A, 1 Trips
			The Primary Processor's Error Correcting Code hardware in the flash memory detects an error. Covers all software and calibrations.	254 failures detected via Error Correcting Code			Diagnostic runs continuously via the flash hardware.	
			The Primary Processor's calculated checksum does not match the stored checksum value for a selected subset of the calibrations.	2 consecutive failures detected or 5 total failures detected.			Diagnostic runs continuously. Will report a detected fault within 200 ms.	
			The Secondary Processor's calculated checksum does not match the stored checksum value. Covers all software and calibrations.	1 failure if the fault is detected during the first pass. 5 failures if the fault occurs after the first pass is complete.			Diagnostic runs continuously in the background.	
				In all cases, the failure count is cleared when controller shuts down

<b>Component/ System</b>	<b>Fault Code</b>	<b>Monitor Description</b>	<b>Malfunction Criteria</b>	<b>Threshold Value</b>	<b>Secondary Parameters</b>	<b>Enable Conditions</b>	<b>Time Required</b>	<b>MIL Illum.</b>
Control Module Not Programmed	P0602	This DTC will be stored if the ECU is a service part that has not been programmed.	Service (reflash) controller calibration present	= 1		none	Diagnostic runs at powerup and once per second continuously after that	Type A, 1 Trips

### 16 OBDG02 ECM Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
ECM Long Term Memory Reset	P0603	This DTC detects an invalid NVM.	Static NVM region error detected during initialization				Diagnostic runs at controller power up.	Type A, 1 Trips
			Perserved NVM region error detected during initialization				Diagnostic runs at controller power up.	
			ECC ROM fault detected in NVM Flash region				Diagnostic runs at controller power up.	
			ECC ROM Error Count >	3				
			Perserved NVM region error detected during shut down.				Diagnostic runs at controller power down.	

**16 OBDG02 ECM Summary Tables (Initial DTCs)**

<b>Component/ System</b>	<b>Fault Code</b>	<b>Monitor Description</b>	<b>Malfunction Criteria</b>	<b>Threshold Value</b>	<b>Secondary Parameters</b>	<b>Enable Conditions</b>	<b>Time Required</b>	<b>MIL Illum.</b>
ECM RAM Failure	P0604	Indicates that the ECM has detected a RAM fault	Indicates that the primary processor is unable to correctly read data from or write data to system RAM. Detects data read does not match data written >=	254 counts			Will finish first memory scan within 30 seconds at all engine conditions - diagnostic runs continuously (background loop)	Type A, 1 Trips
			Indicates that the primary processor is unable to correctly read data from or write data to cached RAM. Detects data read does not match data written >=	254 counts			Will finish first memory scan within 30 seconds at all engine conditions - diagnostic runs continuously (background loop)	
			Indicates that the primary processor is unable to correctly read data from or write data to TPU RAM. Detects data read does not match data written >=	5 counts			Will finish first memory scan within 30 seconds at all engine conditions - diagnostic runs continuously (background loop)	
			Indicates that the primary processor detects a mismatch between the data and dual data is found during RAM updates. Detects a mismatch in data and dual data updates >	0.45588 s			When dual store updates occur.	

**16 OBDG02 ECM Summary Tables (Initial DTCs)**

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
			Indicates that the primary processor detects an illegal write attempt to protected RAM. Number of illegal writes are >	65,534 counts			Diagnostic runs continuously (background loop)	
			Indicates that the secondary processor is unable to correctly read data from or write data to system RAM. Detects data read does not match data written >=	5 counts			Will finish first memory scan within 30 seconds at all engine conditions - diagnostic runs continuously (background loop)	

### 16 OBDG02 ECM Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Internal ECM Processor Integrity Fault	P0606	Indicates that the ECM has detected an internal processor integrity fault	Loss or invalid message of SPI communication from the Secondary Processor at initialization detected by the Primary Processor or loss or invalid message of SPI communication from the Secondary Processor after a valid message was received by the Primary Processor	Loss or invalid message at initialization detected or loss or invalid message after a valid message was received		Run/Crank voltage >= 6.41 or Run/Crank voltage >= 11.00 , else the failure will be reported for all conditions	In the primary processor, 159 / 399 counts intermittent or 39 counts continuous; 39 counts continuous @ initialization. 12.5 ms /count in the ECM main processor	Type A, 1 Trips
			Loss or invalid message of SPI communication from the Primary Processor at initialization detected by the Secondary Processor or loss or invalid message of SPI communication from the Primary Processor after a valid message was received by the Secondary Processor	Loss or invalid message at initialization detected or loss or invalid message after a valid message was received			In the secondary processor, 20 / 200 counts intermittent or 0.1875 s continuous; 0.4750 s continuous @ initialization. 12.5 ms /count in the ECM secondary processor	
			Checks for stack over or underflow in secondary processor by looking for corruption of known pattern at stack boundaries. Checks number of stack over/ under flow since last powerup reset >=	3		KeMEMD_b_StackLimitTestEnbl == 1 Value of KeMEMD_b_StackLimitTestEnbl is: 1 . (If 0, this test is disabled)	variable, depends on length of time to corrupt stack	
			MAIN processor is verified by responding to a seed sent from the secondary with a key response to secondary. Checks number of incorrect keys	2 incorrect seeds within 8 messages, 0.2000 seconds		ignition in Run or Crank	150 ms for one seed continually failing	

**16 OBDG02 ECM Summary Tables (Initial DTCs)**

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
			received > or Secondary processor has not received a new within time limit					
			Time new seed not received exceeded			always running	0.450 seconds	
			MAIN processor receives seed in wrong order			always running	3 / 17 counts intermittent. 50 ms/count in the ECM main processor	
			2 fails in a row in the Secondary processor's ALU check			KePISD_b_ALU_TestEnbl d == 1 Value of KePISD_b_ALU_TestEnbl d is: 1. (If 0, this test is disabled)	25 ms	
			2 fails in a row in the Secondary processor's configuration register masks versus known good data			KePISD_b_ConfigRegTes tEnbl d == 1 Value of KePISD_b_ConfigRegTes tEnbl d is: 1. (If 0, this test is disabled)	12.5 to 25 ms	
			Secondary processor detects an error in the toggling of a hardware discrete line controlled by the MAIN processor: number of discrete changes > = or < = over time window(50ms)	7 17		KePISD_b_MainCPU_SO H_FltEnbl == 1 Value of KePISD_b_MainCPU_SO H_FltEnbl is: 0 . (If 0, this test is disabled)  time from initialization >= 0.4875 seconds	50 ms	
			Software background task first pass time to complete exceeds			Run/Crank voltage > 6.41	360.000 seconds

Fuel Pump Driver Control Module Signal Message Counter Incorrect	P129E	To detect if the command message received as serial data from the engine control module is valid The "rolling count check" value is created by adding an appended hexadecimal calculation to the pump duty cycle command value. In order to achieve a desired fuel pressure, a hexadecimal equivalent value representing the necessary fuel pump current pulse "On" time ( duty cycle as a percent value) is transmitted to the FPPM. The corresponding "check" value is transmitted as well. At the FPPM, the received duty cycle command value is used to create an expected "rolling count" value using the same calculation method as the ECM. The expected "rolling count" value calculated at the receiving power module ( smart device) is compared to the transmitted "rolling count" value. If these do not match, a fault condition is reported	FPPM Received Duty Cycle Rolling Count	<> Transmitted Duty Cycle Rolling Count ( ECM) ( Fu Pmp Pwr Mod smart device reports Faulted, Not Faulted or Indeterminate test state)	a) FPPM configuration KeFRPR_e_ChassisFuel PresSysType b) Fault state determination enabled c) FPPM Received Duty Cycle Count result d) FPPM Diagnostic feedback received e) CAN communication f) System Voltage	a) == CeFRPR_e_ECM_FPPM_Sys b) == TRUE c) == Valid d) == TRUE e) == Valid f) 9v < Sys Voltage > 32v	64 failures / 80 samples  1 sample / 12.5 millisec	Type B, 2 Trips

<b>Component/ System</b>	<b>Fault Code</b>	<b>Monitor Description</b>	<b>Malfunction Criteria</b>	<b>Threshold Value</b>	<b>Secondary Parameters</b>	<b>Enable Conditions</b>	<b>Time Required</b>	<b>MIL Illum.</b>
Fuel Pump Driver Control Module Enable Circuit Performance	P12A6	The purpose of the Fuel Pump Driver Control Module Enable Circuit Performance Diagnostic is to detect if the state of the fuel control enable circuit is valid. This is accomplished by comparing the fuel control enable state [high or low] reported by the Fuel Pump Driver Control Module to the expected state of the fuel control enable signal in the ECM [in software]. When the reported state does not match the expected state, the fail counter increments.	FPPM Fuel Control Enable Active boolean	<> Fuel Control Enable variable (ECM)	a) FPPM configuration KeFRPR_e_ChassisFuelPresSysType b) Diagnostic KeFRPR_b_FPPM_FuelCntrlEnblEnbld c) FPPM Control Data Rolling Count result d) Diagnostic feedback received e) System Voltage	a) == CeFRPR_e_ECM_FPPM_Sys b) == TRUE c) == Valid d) == TRUE e) >= 9.0 v	40 failures / 80 samples  1 sample / 12.5 millisec	Type A, 1 Trips

16 OBDG02 ECM Summary Tables (Initial DTCs)

Component/System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Post Catalyst Fuel Trim System Low Limit Bank 1 (Too Rich)	P2096	<p>Determines if the post catalyst O2 sensor based fuel control system is indicating a rich exhaust gas condition. If the rich condition is such that the control system utilizes all or most of its available low limit authority (low limit = -100% authority), then P2096 will set.</p> <p>The monitor can be calibrated to fail based on the Average Integral Offset % Authority, or based on the Average Integral Offset % Authority AND Average Total Offset % Authority. The Average Total Offset metric consists of the average of the Integral Offset+ Proportional Offset.</p> <p>Note: When the post catalyst O2 voltage is too rich, the post catalyst O2 integral and proportional offset control is decreased (negative % authority). This applies a lean bias to fuel control in an attempt to counteract the rich condition. Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Control Module Throttle Actuator Position Performance	P2101	1) Detect a throttle positioning error. This is determined if the difference between measured throttle position and modeled throttle position is greater than a threshold or less than a threshold. This diagnostic only runs when the engine is running and the ignition voltage is high enough and there is not an ignition voltage failure and the throttle position minimum learn is not active and the throttle is being controlled 2) Throttle control is driving the throttle in the incorrect direction. This is determined if the throttle position is greater than a threshold percent and the powertrain relay voltage is high enough and the throttle position minimum learn is active 3) Throttle control exceeds the reduced power limit. This is determined if the throttle position is greater and a threshold and the powertrain relay voltage is high enough and reduced power is active.	Difference between measured throttle position and modeled throttle position >  OR  Difference between modeled throttle position and measured throttle position >	10.00 percent   10.00 percent	TPS minimum learn is not active and Throttle is being Controlled and (Engine Running or Ignition Voltage > or Ignition Voltage > )      Ignition voltage failure is false (P1682)	Run/Crank voltage > 6.41  Ignition voltage failure is false (P1682)  TPS minimum learn is not active and Throttle is being Controlled  AND  ( (Engine Running AND Ignition Voltage > 5.50 ) OR Ignition Voltage > 8.41 )	15 counts; 12.5 ms/count in the primary processor	Type A, 1 Trips

### 16 OBDG02 ECM Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Bank 1 Air-Fuel Ratio Imbalance	P219A	This monitor determines if there is an Air Fuel Imbalance in the fueling system for a cylinder on a Bank 1. Detection is based on a the pre catalyst oxygen sensor voltage. The pre catalyst voltage is used to generate a variance metric that represents the statistical variation of the O2 sensor voltage over a given engine cycle. This metric is proportional to the air-fuel ratio imbalance (variance is higher with an imbalance than without). Multiple samples are collected in making a decision then normalized and calculated into a EWMA filtered ratio that is compared to the failure limit to set the fault.	<p>Filtered Ratio &gt;</p> <p>Note: The input to this metric is the pre catalyst oxygen sensor voltage. This voltage is used to generate a Variance metric that represents the statistical variation of the O2 sensor voltage over a given engine cycle. This metric is proportional to the air-fuel ratio imbalance (variance is higher with an imbalance than without). Multiple samples are collected in making a decision.</p> <p>The observed Variance is dependant on engine speed and load and so each result is normalized for speed and load by comparing it to a known "good system" result for that speed and load, and generating a Ratio metric.</p> <p>The Ratio metric is calculated by selecting the appropriate threshold calibration from a 17x17 table (see Supporting Table <b>P219A Variance Threshold Bank1 Table</b>) and subtracting it from the measured Variance. The result is then divided by a normalizer calibration</p>	1.00	<p>System Voltage</p> <p>Fuel Level</p> <p>Engine Coolant Temperature</p> <p>Cumulative engine run time</p> <p>Diagnostic enabled at Idle (regardless of other operating conditions)</p> <p>Engine speed range</p> <p>Engine speed delta during a short term sample period</p> <p>Mass Airflow (MAF) range</p> <p>Cumulative delta MAF during a short term sample period</p> <p>Filtered MAF delta between samples Note: first order lag filter coefficient applied to MAF = 0.100</p> <p>Air Per Cylinder (APC)</p> <p>APC delta during short term sample period</p>	<p>no lower than 10.0 Volts for more than 0.2 seconds</p> <p>&gt; 10.0 percent AND no fuel level sensor fault</p> <p>&gt; -20 deg. C (or OBD Coolant Enable Criteria = TRUE)</p> <p>&gt; 30.0 seconds</p> <p>No</p> <p>1,000 to 6,000 RPM</p> <p>&lt; 250 RPM</p> <p>5 to 200 g/s</p> <p>&lt; 5 g/s</p> <p>&lt; 0.25 g/s</p> <p>100 to 700 mg/cylinder</p> <p>&lt; 70 mg/cylinder</p>	<p>Minimum of 1 test per trip, up to 7 tests per trip during RSR or FIR.</p> <p>The front O2 sensor voltage is sampled once per cylinder event. Therefore, the time required to complete a single test (when all enable conditions are met) decreases as engine speed increases. For example, 15.00 seconds of data is required at 1000 rpm while double this time is required at 500 rpm and half this time is required at 2000 rpm. This data is collected only when enable conditions are met, and as such significantly more operating time is required than is indicated above. Generally, a report will be</p>	Type A, 1 Trips

			<p>from another 17 x 17 table (see Supporting Table <b>P219A Normalizer Bank1 Table</b> ). This quotient is then multiplied by a quality factor calibration from a 17 x 17 table (see Supporting Table <b>P219A Quality Factor Bank1 Table</b> ). This result is referred to as the Ratio. Note that the quality factor ranges between 0 and 1 and represents robustness to false diagnosis in the current operating region. Regions with low quality factors are not used.</p> <p>Finally, a EWMA filter is applied to the Ratio metric to generate the Filtered Ratio malfunction criteria metric. Generally, a normal system will result in a negative Filtered Ratio while a failing system will result in a positive Filtered Ratio.</p> <p>The range of the Filtered Ratio metric is application specific since both the emissions sensitivity and relationship between imbalance and the Variance metric are application specific.</p> <p>Some applications may</p>		<p>Filtered APC delta between samples Note: first order lag filter coefficient applied to APC = 0.100</p> <p>Spark Advance</p> <p>Throttle Area (percent of max)</p> <p>Intake Cam Phaser Angle</p> <p>Exhaust Cam Phaser Angle</p> <p>Quality Factor (QF) QF calibrations are located in a 17x17 lookup table versus engine speed and load (see Supporting Table <b>P219A Quality Factor Bank1 Table</b> ). QF values less than "1" indicate that we don't have 4sigma/2sigma robustness in that region. The quality of the data is determined via statistical analysis of Variance data.</p> <p>Fuel Control Status Closed Loop and Long Term FT Enabled for:</p>	<p>&lt; 10.00 percent</p> <p>0 to 100 degrees</p> <p>0 to 200 percent</p> <p>0 to 100 degrees</p> <p>0 to 100 degrees</p> <p>&gt;= 0.99</p> <p>&gt;= 1.2 seconds (Please see "<b>Closed Loop Enable Clarification</b>" and "<b>Long Term FT Enable Criteria</b>" in Supporting Tables)</p>	<p>made within 5 minutes of operation.</p> <p>For RSR or FIR, 7 tests must complete before the diagnostic can report.</p>

### 16 OBDG02 ECM Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Evaporative Emission System Leak Detection Pump Control Open Circuit  (ELCP Vented Fuel System)	P2400	Diagnoses the leak detection pump low side driver circuit for circuit faults.	Voltage low during driver off state (indicates open circuit)	Open circuit: ≥ 200 K Ω impedance between signal and controller ground			20 failures out of 25 samples  250 ms / sample	Type B, 2 Trips

### 16 OBDG02 ECM Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Evaporative Emission System Leak Detection Pump Control Circuit Low  (ELCP Vented Fuel System)	P2401	Diagnoses the leak detection pump low side driver circuit for circuit faults.	Voltage low during driver off state (indicates short to ground)	Short to ground: ≤ 0.5 Ω impedance between signal and controller ground			20 failures out of 25 samples  250 ms / sample	Type B, 2 Trips

### 16 OBDG02 ECM Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Evaporative Emission System Leak Detection Pump Control Circuit High  (ELCP Vented Fuel System)	P2402	Diagnoses the leak detection pump low side driver circuit for circuit faults. If the P2402 is active, an intrusive test is performed with the pump commanded on for 15 seconds.	Voltage low during driver on state (indicates short to power)	Short to power: ≤ 0.5 Ω impedance between signal and controller power			20 failures out of 25 samples  250 ms / sample	Type B, 2 Trips

### 16 OBDG02 ECM Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Evaporative Emission System Switching Valve Control Open Circuit  (ELCP Vented Fuel System)	P2418	Diagnoses the switching valve low side driver circuit for circuit faults.	Voltage low during driver off state (indicates open circuit)	Open circuit: ≥ 200 K Ω impedance between signal and controller ground			20 failures out of 25 samples  250 ms / sample	Type B, 2 Trips

### 16 OBDG02 ECM Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Evaporative Emission System Switching Valve Control Circuit Low  (ELCP Vented Fuel System)	P2419	Diagnoses the switching valve low side driver circuit for circuit faults.	Voltage low during driver off state (indicates short to ground)	Short to ground: ≤ 0.5 Ω impedance between signal and controller ground			20 failures out of 25 samples  250 ms / sample	Type B, 2 Trips

### 16 OBDG02 ECM Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Evaporative Emission System Switching Valve Control Circuit High  (ELCP Vented Fuel System)	P2420	Diagnoses the switching valve low side driver circuit for circuit faults. If the P2420 is active, an intrusive test is performed with the switching valve commanded on for 15 seconds.	Voltage low during driver on state (indicates short to power)	Short to power: ≤ 0.5 Ω impedance between signal and controller power			20 failures out of 25 samples  250 ms / sample	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
ELCP Switching Valve Control Performance  (ELCP Vented Fuel System)	P2450	This DTC detects a ELCP switching valve that is stuck.	When the ELCP vacuum pump is commanded on and the ELCP switching valve transitions from vent to pump position, if the difference between the 1st 0.020" orifice reference vacuum measurement and the ELCP pressure sensor (gauge) vacuum reading is after then the ELCP switching valve is stuck and the DTC fails.	< 400 Pa 5 seconds	Propulsion system not active time  Distance since assembly plant Drive distance Min baro Max baro Min fuel level Max fuel level ECT Min IAT Max IAT Time since last test when passing P0442/P0455 Time since last test when failing P0442/P0455 ***** ELCP hardware can be powered by battery or powertrain relay. ### 16 OBDG02 ECM Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Evaporative Emission System Leak Detection Pump Pressure Sensor Circuit Low Voltage  (ELCP Sealed/ Vented Fuel System)	P24BA	This DTC will detect an ELCP pressure sensor signal that is too low out of range.	ELCP pressure sensor signal	< 0.70 volts ( 14.0 % of Vref or ~ 47 kPa)			640 failures out of 800 samples  12.5 ms / sample	Type B, 2 Trips

### 16 OBDG02 ECM Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Evaporative Emission System Leak Detection Pump Pressure Sensor Circuit High Voltage  (ELCP Sealed/ Vented Fuel System)	P24BB	This DTC will detect an ELCP pressure sensor signal that is too high out of range.	ELCP pressure sensor signal	> 4.85 volts ( 97.0 % of Vref or ~ 123 kPa)			640 failures out of 800 samples  12.5 ms / sample	Type B, 2 Trips

### 16 OBDG02 ECM Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Ignition Switch Accessory Position Circuit Low  (EREV/ PHEV only)	P2537	This DTC checks for short to low voltage circuit failures during operation.	The ECM detects that the state of the accessory line is low when it should be high.  The diagnostic is evaluated when Propulsion System Active time is > 5.0 seconds.  Diagnostic fails when pass counts are	< 8 counts.			12.5 ms / sample  Once per trip	Type B, 2 Trips

### **ReducedEngineCapacityMode\_Enable**

#### REDUCED CAPACITY CONTROL ENABLE CONDITIONS:

Conditions below must be met for  $\geq 0.3$  seconds before cylinder deactivation will begin in regular mode

#### Neutral Idle Mode (NI) operational checks:

Allowed in NI (FALSE)

Time NI mode shall be active  $\geq 1.0$  seconds

Vehicle Speed for NI

< 0.0 mph to Enter

> 0.0 mph to Exit

PRNDL position in NI = False      **VCE\_PRNDL\_NI\_Disables** (For details see Supporting Tables)

Engine RPM lower limit for NI > 475 rpm

Transmission gear for NI = FALSE      **VCE\_TransGear\_DisablesNI**(For details see Supporting Tables)

Torque based AFM entry conditions: NI Mode Active

Indicated Torque < **VCE\_NormalMode\_MaxTorque\_Gr5** minus 10.0 Nm

(Function of Gear: **VCE\_NormalMode\_MaxTorque\_Gr1 - Gr8**,for details see Supporting Tables)

#### Normal Mode operational checks:

Engine running (based on engine off time)

Maximum of 30.0 or > **VCE\_StartUpDelayTime** seconds (For details see Supporting Tables)

Engine RPM

> **VCE\_EngineRPM\_LowerLmt** + 50 RPM AND

< **VCE\_EngineRPM\_UpperLmt** - 200 RPM (For details see Supporting Tables)

Vehicle Speed (in Gear)  $\geq 11.2$  mph

Vehicle Speed (P/N)  $\leq 5.0$  mph

Vehicle Speed based on PRNDL < **VCE\_VehicleSpeed\_PRNDL\_Enable**

## 16 OBDG02 Dilution Definitions (Dilution Flags Report)

Engine RPM PRNDL Feature is TRUE (When TRUE, will enable AFM only if transmission is not in a defaulted state)

Engine coolant (deac)  $\geq 40$  and  $\leq 127$  deg C

Ignition voltage  $\geq 11.0$  volts

Engine Oil Temperature  $\geq 20$  and  $\leq 128$  deg C

Engine Oil Pressure  $\geq 200$  and  $\leq 780$  KPa

Oil pump intrusive test = FALSE (refer to P06DD and P06DE)

Oil aeration present: Aeration enabled by engine RPM  $> 3,100$  for 10 second(s), disabled by engine RPM  $< 3,000$  for 50 second(s)

Catalyst Warmup Enabled= FALSE

POPD: Not active

Deceleration Fuel Cut Off: Not active

Fuel shut off (FSO) delay: Not active  $\geq 3$  second(s)

Green Engine mode: Not active

Pedal Position  $< 48$  pct

Brake booster vacuum  $\geq 0$  KPa

Transmission gear = FALSE **VCE\_TransGear\_Disables**(For details see Supporting Tables)

Gear Shift: not currently in progress

4WD State: not = 4 low range

Time since last AFM mode event  $\geq 3$  second(s)

After exiting AFM mode for max time, must be in all cylinder mode for  $\geq 60$  second(s)

Tip in Bump: Not active

AFM is disabled at high percent ethanol: Ethanol concentration  $> 95$  % disables AFM. Once disabled, ethanol concentration must be  $< 90$  % to re-enable

If feature is enabled, AFM is allowed only when percent ethanol learn is not in progress: Feature is FALSE

AFIM diagnostic status: Not active

A/C clutch transition: Not currently in progress

ETC power management mode: Not active

Heater performance: Not in heater performance mode

Torque based AFM entry conditions:

ECO Mode Active: Indicated Torque  $< \text{VCE\_ECOMode\_MaxTorque\_Gr5}$  minus **VCE\\_ECOMode\\_EnableTorqueHyst**  
(Function of Gear: **VCE\\_ECOMode\\_MaxTorque\\_Gr1 - Gr8**, For details see Supporting Tables)

Normal Mode: Indicated Torque  $< \text{VCE\_NormalMode\_MaxTorque\_Gr5}$  minus **VCE\\_NormalMode\\_EnableTorqueHyst**  
(Function of Gear: **VCE\\_NormalMode\\_MaxTorque\\_Gr1 - Gr8**, For details see Supporting Tables)

IF DEACTIVATED, ANY OF THE CONDITIONS BELOW WILL FORCE CYLINDER REACTIVATION:

If deactivation mode is active for  $\geq 480$  seconds

## 16 OBDG02 Dilution Definitions (Dilution Flags Report)

then reactivation will occur if:  $\geq 600$  seconds

Deac mode active or

Delta vacuum  $> 5$  or  $< -5$  kPa

Vehicle Speed for NI exit  $< 0$  Kph

ETC Power management mode: Active

Converter overtemp protect: Active

Hot coolant mode: Active

Engine running = False

Engine overspeed protection: Active

Engine metal overtemp protect: Active

Cat. temp low: Active

Four Wheel Drive: In low range

Engine misfire: Detected

Heater performance: Active

POPD Intrusive tests: Active (see P2270-P2273, P013A-P014B)

Torque based AFM exit conditions:

ECO Mode Active: Indicated Torque  $< \mathbf{VCE\_ECOMode\_MaxTorque\_Gr5}$

(Function of Gear: VCE\_ECOMode\_MaxTorque\_Gr1 - Gr8, For details see Supporting Tables)

Normal Mode: Indicated Torque  $< \mathbf{VCE\_NormalMode\_MaxTorque\_Gr5}$

(Function of Gear: VCE\_NormalMode\_MaxTorque\_Gr1 - Gr8, For details see Supporting Tables)

Engine Vacuum: **VCE\_MinVacReducedTorqMode** (For details see Supporting Tables)

Ignition voltage  $< 11$  volts

Engine coolant  $< 36$  or  $> 131$  Deg C

Vehicle speed  $< 6.2$  mph

Brake booster vacuum  $< 0$  kPa

Engine oil temperature  $< 18$  or  $> 130$  Deg C

Pedal Position  $> 50\%$

Piston Protection: Active

No active DTC's for control enable:

Fault Bundles:

Catalyst Warmup Enabled

EngOilPressureSensorFA

EnginePowerLimited

CrankSensor\_TFTKO

## 16 OBDG02 Fuel Level Flag (Fuel Level Flag)

### **Low Fuel Condition Diagnostic flag**

Flag set to TRUE if the fuel level < 10.0 % AND

No Active DTCs: FuelLevelDataFault, P0462, P0463 for at least 30.0 seconds

### **Transfer Pump is Commanded On Flag**

Fuel Volume in Primary Fuel Tank < 0.0 liters AND

Fuel Volume in Secondary Fuel Tank ≥ 0.0 liters AND

Transfer Pump on Time < P0461, P2066, P2636: Transfer Pump Enable (see supporting table for numeric value) AND

Transfer Pump had been Off for at least 0.0 seconds AND

Evap Diagnostic (Purge Valve Leak Test, Large Leak Test, and Waiting for Purge) is not running AND

Engine Running

## 16 OBDG02 DFCO Conditions (DFCO Conditions)

### DFCO Enable Conditions

#### COOLANT ENABLE CRITERIA

Coolant temperature < **DFCO\_CoolEnblHi\_Temp** °C See Supporting Table

#### RUN TIME ENABLE CRITERIA

Engine run time > **DFCO\_DelayAfterStart\_Time** seconds See Supporting Table

#### ENGINE SPEED ENABLE CRITERIA

##### TORQUE CONVERTER CLUTCH UNLOCK

###### POPD OFF:

- i) enabled when engine speed > (1,400.0 + supporting table value **DFCO\_EngSpdEnblOfst**)
- ii) once enabled continue to be enabled until engine speed < (1,400.0 + supporting table value **DFCO\_EngSpdEnblOfst**)

###### POPD ON:

- i) enabled when engine speed > (1,000.0 + supporting table value **DFCO\_EngSpdEnblOfst**)
- ii) once enabled continue to be enabled until engine speed < (1,000.0 + supporting table value **DFCO\_EngSpdEnblOfst**)

##### TORQUE CONVERTER CLUTCH LOCK

###### POPD OFF:

- i) enabled when engine speed > (1,000.0 + supporting table value **DFCO\_EngSpdEnblOfst**)
- ii) once enabled continue to be enabled until engine speed < (900.0 + supporting table value **DFCO\_EngSpdEnblOfst**)

###### POPD ON:

- i) enabled when engine speed > (1,000.0 + supporting table value **DFCO\_EngSpdEnblOfst**)
- ii) once enabled continue to be enabled until engine speed < (1,000.0 + supporting table value **DFCO\_EngSpdEnblOfst**)

#### VEHICLE SPEED CRITERIA:

- i) enabled when vehicle speed >= (**DFCO\_EnblHi\_Vehicle\_Speed**)
- ii) once enabled continue to be enabled until vehicle speed < **DFCO\_DsblLo\_Vehicle\_Speed**

#### TORQUE CRITERIA :

- i) enabled when following AND conditions satisfied
  - (a) driver raw trq delta = raw torque - zero pedal torque <= 65,535.0
  - b) driver shaped trq delta1 = shaped immediate torque - zero pedal torque <= 1.0
  - c) driver shaped trq delta2 = shaped predicted torque - minimum combustion unmanaged torque = 65,535.0
  - d) driver shaped trq delta3 = shaped immediate torque - minimum combustion managed torque <= 65,535.0
- ii) once enabled, disabled when following OR conditions are satisfied
  - a) driver raw trq delta1 = raw torque - zero pedal torque > 5.0
  - b) driver shaped trq delta2 = zero pedal torque - minimum combustion managed torque > 65,535.0

#### CATALYST TEMPERATURE

- i) enabled based on following AND criteria
  - a) (CatTemp < 870.0 °C and vehicle speed < 50.0 kph)
  - b) CatTemp < 900.0 °C
  - c) CatTemp >= 300.0 °C

## 16 OBDG02 DFCO Conditions (DFCO Conditions)

d) CatalystWarmupEnabled = FALSE

ii) once enabled, disabled when following OR conditions are met

### OTHER CONDITIONS:

- a) Transmission is not about to unlock
- b) Engine not about to stall
- c) Transmission is not shifting if already not in DFCO
- d) POPD or EOSD
  - 1) POPD requesting DFCO or neither requesting DFCO OFF nor inhibit DFCO
  - 2) EOSD not active
- e) EVAP does not inhibit DFCO
- f) O2 response test is not inhibiting DFCO event
- g) Throttle is not in default mode

16 OBDG02

**Initial Supporting table - Multiple DTC Use - Block learn cells to enable Post oxygen sensor tests**

**Description:** KaPOPD\_PostCellEnbl - A table of adaptive (Block Learn) cells in which to enable the post oxygen sensor tests.

**Notes:** Note: When Table column headings match the calibration value below it, that individual cell is enabled.

The cell numbers in the table are defined as:

- CeFADR\_e\_Cell00\_PurgOnAirMode5 = 0,
- CeFADR\_e\_Cell01\_PurgOnAirMode4 = 1,
- CeFADR\_e\_Cell02\_PurgOnAirMode3 = 2,
- CeFADR\_e\_Cell03\_PurgOnAirMode2 = 3,
- CeFADR\_e\_Cell04\_PurgOnAirMode1 = 4,
- CeFADR\_e\_Cell05\_PurgOnAirMode0 = 5,
- CeFADR\_e\_Cell06\_PurgOnIdle = 6,
- CeFADR\_e\_Cell07\_PurgOnDecel = 7,
- CeFADR\_e\_Cell08\_PurgOffAirMode5 = 8,
- CeFADR\_e\_Cell09\_PurgOffAirMode4 = 9,
- CeFADR\_e\_Cell10\_PurgOffAirMode3 = 10,
- CeFADR\_e\_Cell11\_PurgOffAirMode2 = 11,
- CeFADR\_e\_Cell12\_PurgOffAirMode1 = 12,
- CeFADR\_e\_Cell13\_PurgOffAirMode0 = 13,
- CeFADR\_e\_Cell14\_PurgOffIdle = 14,
- CeFADR\_e\_Cell15\_PurgOffDecel = 15

**Initial Supporting table - Multiple DTC Use\_Green Sensor Delay Criteria - Airflow**

**Description:** This Calibration is the airflow (in gps) above which the green airflow is accumulated to expire the condition.

**Notes:** Used for: P0133, P013A, P013B, P013C, P013D, P013E, P013F, P014A, P014B, P0153, P015A, P015B, P015C, P015D, P1133, P1153, P2270, P2271, P2272 and P2273. The specific diagnostic (from summary table) will not be enabled until the next ignition cycle after the airflow criteria below (by sensor location) has been met:

y/x	1
1	20

16 OBDG02

**Initial Supporting table - Multiple DTC Use\_Green Sensor Delay Criteria - Limit**

**Description:** This Calibration is the accumulated airflow (in grams) limit above which the green condition is expired

**Notes:** Used for: P0133, P013A, P013B, P013C, P013D, P013E, P013F, P014A, P014B, P0153, P015A, P015B, P015C, P015D, P1133, P1153, P2270, P2271, P2272 and P2273. Note: This feature is only enabled when the vehicle is new and cannot be enabled in service

16 OBDG02

Initial Supporting table - IdleSCD\_Decel

**Description:** Crankshaft decel threshold while in SCD mode. SCD mode uses smaller windows near TDC. Thresholds are a function of rpm and % engine Load.

**Notes:** Used for P0300-P0308. Cal Name: KtMISF\_dt\_SCD\_IdleMode

Note: Misfire's Load term is %, but not PID\$04. PID \$04 is not robust to temperature and altitude shifts. (especially decel and jerk thresholds since they track actual air trapped in cylinder)

16 OBDG02

**Initial Supporting table - P050D\_P1400\_CatalystLightOffExtendedEngineRunTimeExit**

**Description:** Exit Catalyst Warm-up mode if Engine Run Time is greater than this value. This table is based on percent ethanol (x-axis) and catmon's NormRatio\_EWMA value (y-axis). The NormRatio\_EWMA value determines the state of the catalyst. Typically, NormRatio\_EWMA values below 0.35 (0 is bad and 1 is good) represent catalysts that have degraded. The emission performance of these degraded catalysts can be improved by extending catalyst light off of GetE85R\_Pct\_FFS\_CompAtEngFloat.

**Notes:** KtCSEC\_t\_ExtendedEngineExit. Used for both P050D and P1400.

16 OBDG02

**Initial Supporting table - P1400\_ColdStartDiagnosticDelayBasedOnEngineRunTime**

**Description:** Quality weight-based on engine run time. This allows adjustment of the weighting factors at various engine run times in order to prevent the updating of the cumulative quality timer or to change the value of the average qualified residual energy calculation to prevent false Fails of the diagnostic under circumstances inappropriate to update the calculation of the average qualified residual value.

**Notes:** KtCSED\_K\_TimeWght - This is used for P1400.

16 OBDG02

**Initial Supporting table - P1400\_ColdStartDiagnosticDelayBasedOnEngineRunTimeCalAxis**

**Description:** This is the x-axis for the KtCSED\_K\_TimeWght calibration table. Refer to the description for KtCSED\_K\_TimeWght for details.

**Notes:** KnCSED\_t\_TimeWght - This is used for P1400.

1	0	3	3	5	11	16	21	27	32

16 OBDG02

**Initial Supporting table - P1400\_EngineSpeedResidual\_Table**

**Description:** This 1x17 table of engine exhaust flow values is used to calculate both the desired and the actual engine exhaust flow based on desired and actual engine speed. The desired engine exhaust flow is gathered from the desired engine speed (VeSPDR\_n\_EngDsrd). The value used for the actual engine exhaust flow is based on the actual engine RPM value.

**Notes:** KtCSED\_dm\_Exh - This is used for P1400

1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

16 OBDG02

**Initial Supporting table - P1400\_SparkResidual\_Table**

**Description:** Predicted engine-out energy potential based on either the desired cold start spark advance value or the actual spark advance value. ExhEngyPerUnitMass calibration is used to calculate both desired exhaust energy and actual energy. The desired and actual exhaust energy per unit mass values are used in part to calculate the desired exhaust energy per unit time and actual exhaust energy per unit time. Both desired and actual go into the residual exhaust energy per unit time calculation.

**Notes:** KtCSED\_E\_ExhEngyPerUnitMass

CiFCLP_LightAccel	2,048	2,048
CiFCLP_HeavyAccel	2,048	2,048

16 OBDG02

**Initial Supporting table - Closed Loop Enable Clarification - KcFCLP\_Cnt\_O2RdyCyclesThrsh**

**Description:** Number of post catalyst oxygen sensor samples which must be outside not ready window before post oxygen sensor is READY.

**Notes:** Time (events \* 12.5 milliseconds)

y/x	1
1	80

16 OBDG02

**Initial Supporting table - Closed Loop Enable Clarification - KcFULC\_O2\_SensorReadyEvents**

**Description:** Number of times an oxygen sensor value must be in range before declaring it ready

**Notes:** Time (events \* 12.5 milliseconds)

y/x	1
1	10

16 OBDG02

**Initial Supporting table - Closed Loop Enable Clarification - KeFCLP\_dm\_IntegrationAirflowMax**

**Description:** Maximum allowed estimated airflow for post O2 integral terms to be updated.

**Notes:** Grams per Second

y/x	1
1	512

16 OBDG02

**Initial Supporting table - Closed Loop Enable Clarification - KeFCLP\_Pct\_CatAccuSlphrPostDsbl**

**Description:** Sulphur percent threshold above which post integral learning is disabled if the threshold criteria KaFCLP\_U\_SlphrIntglOfst\_Thrsh is also met.

**Notes:** Percent

y/x	1
1	255

16 OBDG02

**Initial Supporting table - Closed Loop Enable Clarification - KeFCLP\_T\_IntegrationCatalystMax**

**Description:** Maximum allowed estimated catalytic converter temperature for post O2 integral terms to be updated.

**Notes:** Modeled catalyst Temperature in Celcius

y/x	1
1	860

16 OBDG02

**Initial Supporting table - Closed Loop Enable Clarification - KeFCLP\_T\_IntegrationCatalystMin**

**Description:** Minimum allowed estimated catalytic converter temperature to begin using post O2 integration correction terms. Converter temperature must remain above this threshold to ramp-in the post O2 integration adjustments. Once the ramp-in has started, a converter temperature below this threshold will freeze the ramp-in multiplier. Post O2 integration will not be allowed below this converter temperature

**Notes:** Modeled catalyst Temperature in Celcius

y/x	1
1	450

16 OBDG02

**Initial Supporting table - Closed Loop Enable Clarification - KeWRSC\_T\_HtrCntrlCL**

**Description:** WRAF heater temperature enabling threshold for transition from Open Loop to Closed Loop

**Notes:** Degrees Celcius

y/x	1
1	0

16 OBDG02

**Initial Supporting table - Closed Loop Enable Clarification - KeWRSI\_T\_PumpCurrentEnable**

**Description:** WRAF heater temperature threshold for enabling the sensor pump current

**Notes:** Degrees Celcius

y/x	1
1	600

16 OBDG02

**Initial Supporting table - Closed Loop Enable Clarification - KfFCLL\_T\_AdaptiveHiCoolant**

**Description:** LTM learning is inhibited if the engine coolant temperature is above this calibration.

**Notes:** Degrees Celcius

y/x	1
1	120

16 OBDG02

**Initial Supporting table - Closed Loop Enable Clarification - KfFCLL\_T\_AdaptiveLoCoolant**

**Description:** LTM learning is inhibited if the engine coolant temperature is below this calibration.

**Notes:** Degrees Celcius

y/x	1
1	37

16 OBDG02

**Initial Supporting table - Closed Loop Enable Clarification - KfFCLP\_U\_O2ReadyThrshLo**

**Description:** Lower threshold defining not ready window for post oxygen sensor voltage.

**Notes:** Voltage in millivolts

y/x	1
1	1,000

16 OBDG02

**Initial Supporting table - Closed Loop Enable Clarification - KtFCLL\_p\_AdaptiveLowMAP\_Limit**

**Description:** KtFCLL\_p\_AdaptiveLowMAP\_Limit

**Notes:** MAP in KPa

y/x	65	70	75	80	85	90	95	100	105
1	20.0	20.0	20.0	20.0	20.0	20.0	20.0	20.0	20.0

16 OBDG02

**Initial Supporting table - Closed Loop Enable Clarification - KtFCLP\_t\_PostIntglDisableTime**

**Description:** Disable integral offset after engine start for this amount of time.

**Notes:** Time in seconds

y/x	-40	-29	-18	-6	5	16	28	39	50	61	73	84	95	106	118	129	140

16 OBDG02

**Initial Supporting table - P0068\_Delta MAF Threshold f(TPS)**

**Description:** Table of delta MAF values as a function of desired throttle position. The output of this table provides a delta MAF that if the measured minus the estimated MAF exceeds, is considered a fail.

**Notes:** P0068, KtTPSD\_dm\_MAF\_DesThrDelt

y/x	10.00	15.00	20.00	25.00	30.00	35.00	40.00	45.00	100.00
1.00	11.38	14.42	19.95	29.14	61.39	120.00	190.00	230.00	255.00

16 OBDG02

**Initial Supporting table - P0068\_Delta MAP Threshold f(TPS)**

**Description:** Table of delta MAP values as a function of desired throttle position. The output of this table provides a delta MAP that if the measured minus the estimated MAP exceeds, is considered a fail.

**Notes:** P0068, KtTPSD\_p\_MAP\_DesThrDelt

y/x	10.00	15.00	20.00	25.00	30.00	35.00	40.00	45.00	100.00
1.00	30.00	44.00	44.20	44.71	61.85	130.00	190.00	230.00	255.00

16 OBDG02

**Initial Supporting table - P0068\_Maximum MAF f(RPM)**

**Description:** Table of maximum MAF values vs. engine speed. This is the maximum MAF the engine can see under all ambient conditions.

**Notes:** P0068, KtTPSD\_dm\_MaxMAF\_VsRPM

y/x	600.00	1,400.00	2,200.00	3,000.00	3,800.00	4,600.00	5,400.00	6,200.00	7,000.00

16 OBDG02

**Initial Supporting table - P0068\_Maximum MAF f(Volts)**

**Description:** Table of maximum MAF values vs. system voltage. The output of the air meter is clamped to lower values as system voltage drops off.

**Notes:** P0068, KtTPSD\_dm\_MaxMAF\_VsVoltage

y/x	6.00	7.00	8.00	9.00	10.00	11.00	12.00	13.00	14.00
1.00	511.99	511.99	511.99	511.99	511.99	511.99	511.99	511.99	511.99

16 OBDG02

**Initial Supporting table - P0324\_PerCyl\_ExcessiveKnock\_Threshold**

y

**Description:** Fail threshold for the Knock Performance per-cylinder Excessive Knock Diagnostic

**Notes:** Used for P0324. Cal Name: KtKNKD\_k\_PerCylFiltKnkIntThrsh. X-axis = Engine Speed (RPM), Diagnostic fails when VaKNKD\_k\_PerCylKnockIntFilt[cyl] > KtKNKD\_k\_PerCylFiltKnkIntThrsh

y/x	500	1,000	1,500	2,000	2,500	3,000	3,500	4,000	4,500	5,000	5,500	6,000	6,500	7,000	7,500	8,000	8,500
1	1.88	1.88	1.88	1.88	1.88	1.88	1.88	1.88	1.88	1.88	1.88	1.88	1.88	1.88	1.88	1.88	1.88

16 OBDG02

**Initial Supporting table - P0325\_P0330\_OpenCktThrshMax (20 kHz)**

**Description:** Knock Open Circuit Diagnostic Maximum Threshold when using the 20 kHz method (see "OpenMethod" description)

**Notes:** Used for P0325 and P0330. Cal name: KtKNKD\_k\_OpenMax20K. x-axis = Engine Speed (RPM).

Diagnostic fails when the filtered diagnostic output is between the OpenCktThrshMin and OpenCktThrshMax:  
i.e.: KtKNKD\_k\_OpenMin20K < VaKNKD\_k\_OpenFiltIntensity < KtKNKD\_k\_OpenMax20K.

y/x	700	1,000	1,500	2,000	2,500	3,000	3,500	4,000	4,500	5,000	5,500	6,000	6,500	7,000	7,500	8,000	8,500

16 OBDG02

**Initial Supporting table - P0325\_P0330\_OpenMethod\_2**

**Description:** Defines which Knock Open Circuit Diagnostic method to use.

**Notes:** Used for P0325 and P0330. Cal name: KaKNKD\_e\_OpenMethod. x-axis = Engine Speed Index, 500 to 8500 (RPM) by 500 rpm increments.

Selects 1 of 3 available methods: "20kHz Method", "Normal Noise Method," or "None" (note: "None" = disabled at that rpm). The mode chosen dictates which set of threshold tables are used. Typically, either: A) the 20 kHz Method is used for all RPM or B) the 20 kHz Method is used for low/medium RPM and the Normal Noise Method is used for high RPM.

**P0325\_P0330\_OpenMethod\_2 - Part 1**

y/x	0	1	2	3	4
1	CeKNKD_e_Open_20KHz	CeKNKD_e_Open_20KHz	CeKNKD_e_Open_20KHz	CeKNKD_e_Open_20KHz	CeKNKD_e_Open_20KHz

16 OBDG02

**Initial Supporting table - P0326\_P0331\_AbnormalNoise\_CylsEnabled**

**Description:** Specifies which cylinders will be used for the Abnormal Noise portion of the performance diagnostics (1 = cylinder used, 0 = cylinder not used)

**Notes:** Used for P0324, P0326 and P0331. Cal name: KaKNKD\_b\_PerfAbnIncludeCyl. x-axis = Cylinder number in firing order (i.e. Cyl 0 = first cylinder in firing order, Cyl 1 = second cylinder in firing order....)

A cal value = 1 specifies the cylinder is used for the Abnormal Noise diagnostic. A cal value = 0 specifies the cylinder is not used. Only the first four values in the table are relevant for a four-cylinder engine and only the first six values in the table are relevant for a six-cylinder engine.

Typically, all cylinders are used. Cylinders are only excluded if the signal from that cylinder is weak and there is no separation between normal and faulted conditions (can occur if the sensor location results in poor signal-to-noise ratio for a given cylinder).

y/x	0	1	2	3	4	5	6	7
1	1	1	1	1	0	0	0	0

16 OBDG02

**Initial Supporting table - P0326\_P0331\_AbnormalNoise\_Threshold**

**Description:** Fail threshold for the Knock Performance Abnormal Noise Diagnostic

**Notes:** Used for P0324, P0326 and P0331. Cal Name: KtKNKD\_k\_PerfAbnLimitLo. X-axis = Engine Speed (RPM). Diagnostic fails when VaKNKD\_k\_PerfCylAbnFiltIntnsity < KtKNKD\_k\_PerfAbnLimitLo

**16 OBDG02 HPC1 Summary Tables (Initial DTCs)**

<b>Component/ System</b>	<b>Fault Code</b>	<b>Monitor Description</b>	<b>Malfunction Criteria</b>	<b>Threshold Value</b>	<b>Secondary Parameters</b>	<b>Enable Conditions</b>	<b>Time Required</b>	<b>MIL Illum.</b>
Crankshaft Position (CKP) Sensor A Circuit	P0335	Diagnostic will fail if a crank sensor pulse was not received (from the ECM's replicated crank signal) during a period of time; if crank sensor pulses are received, the diagnostic will pass.	No crankshaft pulses received.	Crank Sync State= No Activity for >= 1.40 s	HWIO based crank decode status	= NOT Disable-Crank	Continuous at every 12.5 msec	Type B, 2 Trips

### 16 OBDG02 HPC1 Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Crankshaft Position (CKP) Sensor A Performance	P0336	1. Fail counts will occur if the engine goes out of synchronization repeatedly over a period of time and will pass if the engine stays in synchronization. 2. Diagnostic will fail if synchronization gap is not found in a specified period of time and will pass if the synchronization gap is found.	Time in which 15.00 crank re-synchronizations occur	Crank Sync State transitions to Activity Detected X times in < 10.00 seconds (without seeing "crank in sync")	HWIO based crank decode status	= NOT Disable-Crank	Continuous every 250 msec	Type B, 2 Trips
			No crankshaft synchronization gap found	Crank Sync State = Activity Detected for >= 1.40 s	HWIO based crank decode status	= NOT Disable-Crank	Continuous every 12.5 msec	

**16 OBDG02 HPC1 Summary Tables (Initial DTCs)**

<b>Component/ System</b>	<b>Fault Code</b>	<b>Monitor Description</b>	<b>Malfunction Criteria</b>	<b>Threshold Value</b>	<b>Secondary Parameters</b>	<b>Enable Conditions</b>	<b>Time Required</b>	<b>MIL Illum.</b>
Idle Air Control (IAC) System - RPM Too Low	P0506	This DTC sets when the idle speed is lower than the targeted idle speed	Idle Speed	<p>Fail Criteria: Filtered input speed error (desired - actual), is greater than the fail threshold of 91 RPM. Filter coefficient for engine speed = 0.003</p> <p>Pass Criteria: Filtered input speed error (desired - actual), is less than fail threshold 81 . Filter coefficient for engine speed = 0.003</p>	<p>No Active DTCs:</p> <p>No Active DTCs:</p> <p>No Active DTCs:</p> <p>Accelerator pedal position</p> <p>Engine State</p> <p>Vehicle Speed</p> <p>Engine Coolant</p> <p>Commanded RPM Delta</p> <p>Idle Conditons Present</p>	<p>Motor A speed faults: P0A3F, P1B03, P0A40, P0C52, P0C53, P0C5C, P0C5D</p> <p>Motor B speed faults: P0A45, P1B04, P0A46, P0C57, P0C58, P0C61, P0C62</p> <p>Vehicle Speed/TOS sensor faults: P0722, P077B, P215C</p> <p>Not Defaulted &amp; &lt;= 1.00 %</p> <p>Running (not starting or stopping states)</p> <p>&lt;= 2 kph</p> <p>&gt;= 60.00 Deg C</p> <p>&lt; 50 RPM</p> <p>&gt;= 10.00 seconds</p>	<p>1 loop execution at 100 ms rate</p> <p>Pass condition met for 10.00 seconds</p>	Type B, 2 Trips

<b>Component/ System</b>	<b>Fault Code</b>	<b>Monitor Description</b>	<b>Malfunction Criteria</b>	<b>Threshold Value</b>	<b>Secondary Parameters</b>	<b>Enable Conditions</b>	<b>Time Required</b>	<b>MIL Illum.</b>
System Voltage Performance	P0561	This diagnostic detects a difference in voltage between the 12V input and the Ignition Run/Crank Voltage. The fault sets when the host controller detects the difference is above the indicated threshold for the indicated time.	Difference between 12V Battery Voltage Input and Ignition Run/Crank Voltage	> 3.00 Volts	Enable Calibration is True  Diagnostic System Code Clear Requested  Diagnostic System Reset Complete  Battery input is present  Ignition Run/Crank Voltage  12V Starter Engaged	= 1.00 (1 is Enabled)  = False  = True  = 1.00 (1 is Available)  > 6.0 Volts  = False	4 seconds out of a 5 seconds window	Type C, No SVS

### 16 OBDG02 HPC1 Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
System Voltage Low	P0562	This diagnostic detects low voltage in the vehicle's 12 volt system. The fault sets when the THCP detects supply voltage below the indicated threshold for the indicated time.	Ignition Voltage	≤ 10.00 Volts	Enable Calibration is True  12V Starter Engaged  Ignition Run/Crank Voltage  Engine Speed	= 1.00 (1 is Enabled)  = False  > 6.0 Volts  ≥ 0.00 RPM	5 seconds out of a 6 seconds window	Type C, No SVS

### 16 OBDG02 HPC1 Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
System Voltage High	P0563	This diagnostic detects high voltage in the vehicle's 12 volt system. The fault sets when the host controller detects supply voltage above the indicated threshold for the indicated time.	Ignition Voltage	≥ 16.00 Volts	Enable Calibration is True  Ignition Run/Crank Voltage	= 1.00 (1 is Enabled)  > 6.0 Volts	5 seconds out of a 6 seconds window	Type C, No SVS

### 16 OBDG02 HPC1 Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Control Module Read Only Memory (ROM)	P0601	This Diagnostic tests ROM (flash) memory in the THCP micro-controller. The test checks that ROM has not changed since it was flashed in the plant. The bytes of ROM in different areas (code, calibration, HW configuration, etc.) are summed and compared to a checksum for that area. The checksum is created when the software is built and does not change over time. The DTC sets when the checksum comparison does not match for the indicated number of times.	Calculated Checksum of the Boot ROM	≠ Expected Checksum	Controller Status  ROM Checksum in Progress  (Diagnostic System Code Clear Requested AND Diagnostic System Reset Complete)	= On  ≠ True  = False  = True	1 failure if it occurs during the first ROM test of the ignition cycle otherwise 5 failures	Type A, 1 Trips
			2nd Processor State of Health ROM fault latched	= TRUE	Controller Status  ROM Checksum in Progress  (Diagnostic System Code Clear Requested AND Diagnostic System Reset Complete)	= On  ≠ True  = False  = True	Runs continuously in the background	
			Calculated Checksum of Torque Security Related Calibrations	≠ Expected Checksum	Controller Status  (Diagnostic System Code Clear Requested AND Diagnostic System Reset Complete)  = Disable Calibration is False  = Enable Calibration is True	= On  = False  = True  = 0 (0 is Enabled)  = 1 (1 is Enabled)	1 failure if it occurs during the first ROM test of the ignition cycle otherwise 5 failures

<b>Component/ System</b>	<b>Fault Code</b>	<b>Monitor Description</b>	<b>Malfunction Criteria</b>	<b>Threshold Value</b>	<b>Secondary Parameters</b>	<b>Enable Conditions</b>	<b>Time Required</b>	<b>MIL Illum.</b>
Control Module Not Programmed	P0602	This Diagnostic checks that the THCP micro-controller has a valid calibration flashed into it. The controller manufacturer flashes a calibration with a particular calibration set to 1. At the vehicle plant the controller is reflashed with a valid calibration that also changes the particular calibration set to 0. The DTC sets when the diagnostic checks that particular calibration and it has a nonzero value.	No Start Calibration is True	= 0 (1 is for No Start Condition)	(Diagnostic System Code Clear Requested AND Diagnostic System Reset Complete)	= False  = True	Runs once at controller initialization and every 1 second there after	Type A, 1 Trips

### 16 OBDG02 HPC1 Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Control Module Long Term Memory Reset	P0603	This Diagnostic tests the NonVolatile Memory (NVM) in the THCP micro-controller for changes since the last write at power down. The bytes of various NVM sections are summed and compared to checksums for each section that were stored at the last powerdown. The DTC sets when the checksum comparisons do not match.	Static NVM Checksum at power-up	≠ Checksum at power-down	Ignition Status Enable Calibration is True	= Run or Crank = 1 (1 is Enabled)	1 failure Runs once at controller initialization	Type A, 1 Trips
			Preserved NVM Checksum at power-up	≠ Checksum at power-down	Ignition Status Enable Calibration is True	= Run or Crank = 1 (1 is Enabled)	1 failure Runs once at controller initialization	
			Power Up Reset BINVDM NVM Checksum at power-up	= False ≠ Checksum at power-down	Ignition Status Enable Calibration is True	= Run or Crank = 1 (1 is Enabled)	Runs once at controller initialization 3 out of 5 controller initializations for Failure	
			Dynamic NVM checksum at power-up AND Shutdown Finished	≠ Checksum at power-down = TRUE	Ignition Status Enable Calibration is True	= Run or Crank = 1 (1 is Enabled)	1 failure Runs once at controller initialization	
			Static NVM Error Dynamic NVM Error	= False = False	Enable Calibration is True	= 1 (1 is Enabled)	Runs once at controller initialization	
			BINVDM ECC Error	= False

Control Module Random Access Memory (RAM)	P0604	This Diagnostic tests the RAM in the THCP micro-controller. The diagnostic checks that RAM has not changed unexpectedly. Pattern checks are done at initialization where different patterns are written and then read back. The DTC sets if the patterns do not match. Continuous checks are done while the controller is executing code that store the same variables in multiple locations. When those variables are read, a check is done to be sure both locations still match. A DTC sets if the locations do not match for the indicated time.	Secure redundant "Y" variable	≠ Primary "V" variable for greater than 125 ms	Current Time Execution - Time of Last DualStore Error	> 25 ms	Executes in Background loop	Type A, 1 Trips
			HWIO detects an illegal write to Write Protected RAM	= TRUE	(Diagnostic System Code Clear Requested AND Diagnostic System Reset Complete)	= False  = True	Executes in Background loop  1 count to fail	
			2nd Processor State of Health RAM Fault Latched	= TRUE	(Diagnostic System Code Clear Requested AND Diagnostic System Reset Complete)	= False  = True	Executes in Background loop every 1000ms	
			Checksum of PreservedNVM_Region for Main Processor State of Health and 2nd Processor State Of Health	≠ Expected checksum value	(Diagnostic System Code Clear Requested AND Diagnostic System Reset Complete)	= False  = True	Runs once at Initialization	
			HWIO detects fault in System RAM	= TRUE	(Diagnostic System Code Clear Requested AND Diagnostic System Reset Complete)	= False  = True	Runs once at Initialization  1 count to fail

		<p>The microprocessors in the TPIM ECU monitor that each of the others is executing code correctly and in a timely manner. These fail cases rely on a seed and key interaction where one micro-controller sends a seed and a second controller runs a predefined set of calculations and responds with a key. The first controller sends a seed and checks that the received key matches its lookup table value for that seed and that it was received in time. The second controller checks that the correct seed value has been received and that is in time. The DTC sets when there is a mismatch of seed or key values or the expected key or seed value is out of order or if the key or seed value has not been received in the indicated time.</p> <p>Fail Case 7, 8, 9: These diagnostics are built into the hardware of the THCP microprocessor by the chip manufacturer. Sensor Power Supply C Circuit High	P06E8	This diagnostic monitors the IGBT power supply circuit voltage. The sensed voltage is compared against a threshold. If the sensed voltage is above the failure threshold for sufficient time, the diagnostic will fail.	Scaled 15V IGBT Supply Voltage	> 22.00 V	Wakeup Signal	ON	0.32 seconds out of a 0.4 seconds window (x of y)  OR  Continuous Fail Time > 0.30 seconds	Type A, 1 Trips

### 16 OBDG02 HPC1 Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Transmission Fluid Temperature (TFT) Sensor Performance	P0711	Monitors the performance of Transmission Fluid Temperature (TFT) circuit by comparing the temperature calculated from the resistance vs temp table to an estimated cold soak average temperature or verifying that the temperature calculated from the resistance vs temp table has not latched at a value after a period of time.	Transmission Fluid Temperature Sensor compared to a Cold Soak Average Temperature	$\geq$ (See supporting tables for failure threshold value)	Rationality Enable Calibration is True  Time after init controller  Cold Soak Enable Calibration is True  Cold Soak Average Temperature Message  Cold Soak Average Temperature  P0712, P0713, U179A, U0293  TFT temperature	= 1 (1 is Enabled)  $\geq 3.00$ seconds  = 1 (1 is Enabled)  = Use Data  $\geq -40.00$ C  NOT Fault Active  $-40.00 \leq X \leq 130.00$ C	One diagnostic loop once all enable criteria have been met	Type A, 1 Trips
			Continuous Check for Transmission Fluid Temperature Stuck in Range  Transmission Oil Temperature Raw - Previous Transmission Oil Temperature	$\leq 0.00$ C	Rationality Enable Calibration is True  Time after init controller  Continuous Rationality Enable Calibration is True  Engine Speed  Vehicle Speed  Transmission Oil Temperature Raw	= 1 (1 is Enabled)  $\geq 3.00$ seconds  = 1 (1 is Enabled)  $0.00 \leq X \leq 7,500.00$ RPM for 5.00 seconds  $\leq 124.27$ MPH for 5.00 seconds  $-40.00 \leq X \leq 130.00$ C	$\geq 300.00$ seconds	

### 16 OBDG02 HPC1 Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Transmission Fluid Temperature (TFT) Sensor Circuit Low Voltage	P0712	Monitors the Transmission Fluid Temperature (TFT) sensor circuit resistance and reports a low voltage condition if the sensed resistance is below a threshold.	Transmission Fluid Temperature (TFT) circuit resistance	$\leq 68.60$ ohms (Corresponds to 149 C which is above the operating range of the transmission)	Enable Calibration is True 12V Battery Voltage Ignition Run/Crank Voltage	= 1 (1 is Enabled) > 9.00 for 0.10 seconds > 9.00 for 0.10 seconds	2 seconds out of a 3 seconds window	Type A, 1 Trips

Supply Voltage Circuit 1 Low Voltage	P150E	This diagnostic detects low supply voltage for the circuit 1 path for motor control. If the supply voltage circuit 1 path is below the indicated threshold for the indicated time the DTC is set.	12 volt battery supply circuit 1	< 8.00 Volts	Enable Calibration is True  Diagnostic System Code Clear Requested  Diagnostic System Reset Complete	= 1.00 (1 is Enabled)  = False  = True	2 seconds out of a 2.5 seconds window	Type C, No SVS

### 16 OBDG02 HPC1 Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Alive Rolling Count/ Protection Value Fault - Engine Actual Torque Steady State	P15F0	This diagnostic monitors the signal from the engine control module (ECM) to the THCP microprocessor with the engine torque data. Potential failures include the ECM transceiver, the transmission line, the THCP transceiver and the processing in both microprocessors. If the ECM does not increment an Alive Rolling Count (ARC) with each message or fails to send the message in time or fails to calculate the checksum correctly the fault is set in the THCP.	Current ARC value OR Primary signal value	≠ Previous ARC value plus 1 (0-3)  ≠ Protection Value	Propulsion System Active  Run/Crank Active time AND  Run/Crank Voltage OR Ignition Run/Crank Voltage	= TRUE  >= 0.50 seconds  >= 9.50 V  >= 11.00 V	0.125 seconds out of a 0.2 seconds window	Type A, 1 Trips

### 16 OBDG02 HPC1 Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Control Module Redundant Memory Performance	P16F3	This diagnostic detects RAM faults in real time for those variables that are determined to be safety critical. The DTC sets when the called variable is called and compared to its redundant variable and does not match. There are fail cases for secure vehicle speed, transmission output sensor to wheel speed sensor conversion factor, and the engine torque value.	Rate Limited Secure Vehicle Speed (Re)	≠ Dual Stored Rate Limited Secure Vehicle Speed (Ve)	Run Crank Voltage Enable Calibration is True	>= 11.00 V = 1 (1 is Enabled)	0.125 seconds out of a 0.2 seconds window	Type A, 1 Trips
			TOS to Wheel Speed Conversion Factor	>= 1.10 (High & Neu) OR <= 0.10 (High & Neu)	Run Crank Voltage	>= 11.00 V	0.125 seconds out of a 0.2 seconds window	
			TOS to Wheel Speed Conversion Factor	>= 1.10 (4WD Low) OR <= 0.10 (4WD Low)	Run Crank Voltage	>= 11.00 V	0.125 seconds out of a 0.2 seconds window	
			Engine Actual Torque Steady State WOM (Ve)	≠ Dual Stored Engine Actual Torque Steady State WOM (We)	Run Crank Voltage	>= 11.00 V	0.125 seconds out of a 0.2 seconds window	

### 16 OBDG02 HPC1 Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.	
Control Module Transmissio n Range Control Performance	P16F4	Detects transmission range errors by comparing the Direction IMS switches with the Range IMS information from the THCP.	Valid Range IMS transmission position	≠ Valid Direction IMS transmission position	Run/Crank Voltage	>= 9.50 Volts	150.00 ms out of a 200.00 ms window  Executes in a 25ms loop	Type A, 1 Trips	
		DTC Fail case 1: Positive transmission ranges that do not match	Valid Range IMS transmission position	≠ Error corrected Direction IMS transmission position	Run/Crank Voltage	>= 9.50 Volts	150.00 ms out of a 200.00 ms window  Executes in a 25ms loop		
		DTC Fail case 2: Error corrected Direction IMS does not match							150.00 ms out of a 200.00 ms window  Executes in a 25ms loop
		DTC Fail case 3: Range IMS is between valid transmission positions and Direction IMS is error corrected	Range IMS indicates a transitional state AND Direction IMS has an error corrected transmission position		Run/Crank Voltage	>= 9.50 Volts	150.00 ms out of a 200.00 ms window  Executes in a 25ms loop		
		DTC Fail case 4: Range IMS is invalid and Direction IMS is error corrected	Range IMS is invalid due to a fault or problem with THCP, AND the Direction IMS has an error corrected transmission position		Run/Crank Voltage	>= 9.50 Volts	150.00 ms out of a 200.00 ms window  Executes in a 25ms loop		
		DTC Fail case 5: Range IMS is between valid transmission positions and Direction IMS is invalid	Range IMS indicates a transitional state AND Direction IMS is invalid due to a fault or problem with the THCP		Run/Crank Voltage	>= 9.50 Volts	150.00 ms out of a 200.00 ms window  Executes in a 25ms loop

			Range IMS is invalid due to a fault or problem with the THCP, AND the Direction IMS is invalid due to a fault or a problem with the THCP		Run/Crank Voltage	>= 9.50 Volts	150.00 ms out of a 200.00 ms window  Executes in a 25ms loop	

### 16 OBDG02 HPC1 Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Control Module Commanded Range State	P16F6	This diagnostic verifies the calculation of the Transmission Range State. Potential failure modes could be the calculation of range state, range state transitions or the calculation of input torque does not match the range state. The DTC sets if there are mismatches in system equations, or the transmission range state being executed is invalid, or the transmission range state has performed an invalid transition or the input torque can not be rationalized with the range state.	The current Transmission Range State being used is detected to be an invalid value within the current Transmission range State Group		(Run/Crank Voltage OR Ignition Voltage)  Enable range equation check is True Enable state machine rationality check is True Enable clutch control rationality check is True	>= 11.00 V  >= 9.50 V  = 1 (1 is Enabled) = 1 (1 is Enabled) = 1 (1 is Enabled)	0.2 seconds out of a 0.2125 seconds window	Type A, 1 Trips
			The current Transmission Range State Group being used by the system is an invalid value		(Run/Crank Voltage OR Ignition Voltage)  Enable range equation check is True  Enable state machine rationality check is True  Enable clutch control rationality check is True	>= 11.00 V  >= 9.50 Volts  = 1 (1 is Enabled)  = 1 (1 is Enabled)  = 1 (1 is Enabled)	0.2 seconds out of a 0.2125 seconds window	
			The current Transmission Range State has changed, and the change in value is not one of the supported transitions from the previous Transmission Range State		(Run/Crank Voltage OR Ignition Voltage)  Enable range equation check is True  Enable state machine rationality check is True  Enable clutch control rationality check is True	>= 11.00 V  >= 9.50 V  = 1 (1 is Enabled)  = 1 (1 is Enabled)  = 1 (1 is Enabled)	0.2 seconds out of a 0.2125 seconds window	
			The Range Equation can not be rationalized against the current Transmission Range State		(Run/Crank Voltage OR Ignition Voltage)  Enable range equation check is True	>= 11.00 V  >= 9.50 V  = 1 (1 is Enabled)	0.2 seconds out of a 0.2125 seconds window	

**16 OBDG02 HPC1 Summary Tables (Initial DTCs)**

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
					Enable state machine rationality check is True	= 1 (1 is Enabled)		
					Enable clutch control rationality check is True	= 1 (1 is Enabled)		
			The Torque Determination State can not be rationalized against the current Transmission Range State		(Run/Crank Voltage OR Ignition Voltage)	>= 11.00 V >= 9.50 V	0.2 seconds out of a 0.2125 seconds window	
					Enable range equation check is True	= 1 (1 is Enabled)		
					Enable state machine rationality check is True	= 1 (1 is Enabled)		
					Enable clutch control rationality check is True	= 1 (1 is Enabled)		
			The Input Torque Optimization State can not be rationalized against the current Transmission Range State		(Run/Crank Voltage OR Ignition Voltage)	>= 11.00 V >= 9.50 V	0.2 seconds out of a 0.2125 seconds window	
					Enable range equation check is True	= 1 (1 is Enabled)		
					Enable state machine rationality check is True	= 1 (1 is Enabled)		
					Enable clutch control rationality check is True	= 1 (1 is Enabled)

Hybrid/EV System Discharge Switch Circuit High	P1F65	Monitors the high voltage discharge switch for a circuit high fault	Active discharge circuit high status	HWIO determines if the active discharge resistor is failed high.  =TRUE	Enable calibration is True	= 1 (1 is Enabled)	0.125 seconds out of a 0.15 seconds window	Type B, 2 Trips

**16 OBDG02 HPC1 Summary Tables (Initial DTCs)**

<b>Component/ System</b>	<b>Fault Code</b>	<b>Monitor Description</b>	<b>Malfunction Criteria</b>	<b>Threshold Value</b>	<b>Secondary Parameters</b>	<b>Enable Conditions</b>	<b>Time Required</b>	<b>MIL Illum.</b>
Vehicle Speed Output Shaft Speed Correlation	P215B	The DTC Monitors if the Difference between the Transmission Output Speed, Output Speed Calculated from the Wheel Speed Sensors, and Output Speed Calculated from the Motor Speeds. The DTC sets if 2 of the 3 vehicle speed sources do not match.	Transmission Output Speed and Output Speed Calculated from the Wheel Speed Sensors and Output Speed Calculated from the Motor Speeds difference	> 12.42 mph	Number of Secured Vehicle Speed Sources	CeVSPI_e_ThreeSrcSystem	2.00 seconds	Type A, 1 Trips
					Secured Vehicle Speed Use Transmission Output Speed	1		
					Secured Vehicle Speed Use Wheel Speed	1		
					Secured Vehicle Speed Use Motor Speed	1		

### 16 OBDG02 HPC1 Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Output Shaft Speed (OSS) - Wheel Speed Correlation	P215C	The DTC calculates the difference between the output shaft speed measured from the transmission output speed sensor (TOSS) and the output shaft speed calculated from the average of the wheel speed sensors then reports if they differ from each other by a threshold for a calibrated period of time. There is a different set of enable conditions when the TOS calculated from wheel speeds and TOS calculated from motor speeds are above or below a threshold.	Difference between Transmission Output Speed and the Calculated Average of Output Speed from the Motors and Wheel Speed Sensors	$\geq 50.00$ RPM	Enable Calibration is True  OBD Wheel Speed Sensors  Driven Wheel Estimated Vehicle Speed Fault  Propulsion System Active  TOS calculated from Wheel Speeds  TOS calculated from Motor Speeds	= 1 (1 is Enabled)  True  False  True  $\geq 200.00$ RPM  $\geq 200.00$ RPM	0.23 seconds	Type B, 2 Trips
			Difference between Transmission Output Speed and the Calculated Average of Output Speed from the Motors and Wheel Speed Sensors	$\geq 60.00$ RPM	Enable Calibration is True  OBD Wheel Speed Sensors  Driven Wheel Estimated Vehicle Speed Fault  Propulsion System Active  TOS calculated from Wheel Speeds  TOS calculated from Motor Speeds	= 1 (1 is Enabled)  True  False  True  $\leq 200.00$ RPM  $\leq 200.00$ RPM	0.23 seconds

### 16 OBDG02 HPC1 Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Internal Control Module Drive Motor Control Performance	P3260	This diagnostic checks that the engine speed and motor torque go below thresholds when the driver shifts to neutral. When the driver shifts to neutral and the vehicle speed is below the shown threshold the vehicle should turn off the engine and reduce the motor torque to near zero Nm. When shifted to neutral, if the engine speed does not fall below the threshold or motor torque is not removed in the shown time then the DTC is set. A second fail case is checked after the above conditions are correct the engine speed and motor torque values are continuously monitored to be sure they stay in range, otherwise the DTC is set.	( (Motor A torque AND Ignore Motor A torque)  OR  (Motor B torque AND Ignore Motor B torque)  OR  (Engine speed AND Ignore Engine speed) )	! 1.00 Nm  = 0.00 (0 = use Motor A torque)  ! 1.00 Nm  ! = 1.00 (1 = Do not use Motor B torque)  ! 200.00 RPM  = 0.00 (0 = use Engine speed)	Vehicle speed AND No motor neutral diagnostic enabled AND Gear position	< 5.00 kph  = 1 (1 = Enabled)  = CeHSER_e_N1_RngEqn (Neutral)	Timer from shift to neutral to all conditions being met  > 33.00 seconds  Debounce timer > 375.00 msec	Type A, 1 Trips
			( (Motor A torque AND Ignore Motor A torque)  OR  (Motor B torque AND Ignore Motor B torque)  OR  (Engine speed AND Ignore Engine speed) )	! 1.00 Nm  = 0.00 (0 = use Motor A torque)  < 1.00 Nm  ! = 1.00 (1 = do not use Motor B torque)  ! 200.00 RPM  = 0.00 (0 = use Engine speed)	Case 1 test passed AND  Gear position	= CeHSER_e_N1_RngEqn (Neutral)	Debounce timer > 375.00 msec

**16 OBDG02 HPC2 (BSM) Summary Tables (Initial DTCs)**

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Hybrid/EV Battery Pack Deterioration	P0A7F	This diagnostic monitor compares the calculated hybrid/EV battery pack power capability against a calibrated failure threshold table. The calculated battery power capability is a function of the sensed battery voltage, current, and temperature. The "minimum threshold" is the minimum battery power required to meet necessary vehicle emissions performance at ~ 35 % state of charge (SOC) at 20 C. A new battery would be expected to have reasonably large amounts of power under these conditions, and reduced power capability as the SOC or temperature drops. Because the power capability drops with decreasing SOC below the ~ 35 % point, the failure threshold is reduced proportionally with decreasing SOC from the ~ 35 % point. Above the ~ 35 % point, the failure threshold is held constant with increasing SOC. Because the power capability drops with decreasing	Calculated battery discharge power limits	< KtBSED_P_BPD_D_E ndOfLifePwrThrsh (kW) - see Supporting Tables	Hybrid/EV Battery Temperature  Hybrid/EV Battery SOC  Run Crank Active System Voltage No Active DTCs        Actual battery power exceedance of power limits in terms of % overshoot multiplied by	< 50.00 °C, AND > -10.00 °C  > 35.00 %, AND < 100.00 %  = TRUE > 10.20 V  P0AC1 P0AC2 P1EBA P0ABC P0ABD P0ABB U179C  Battery Temperature Circuit High (see Fault Bundle Page)  Battery Temperature Circuit Low (see Fault Bundle Page)  Battery Temperature Performance (see Fault Bundle Page)  < 80.00 %-Sec	10 failures  100 ms /sample	Type B, 2 Trips

Hybrid Battery Positive Contactor Circuit Stuck Closed	P0AA1	The propulsion positive contactor is a high voltage relay that is used to connect the positive side of the high voltage battery to the positive side of the propulsion bus. This DTC detects when the propulsion positive contactor is stuck closed by monitoring for excessive voltage on the positive side of the propulsion bus when all contactors are commanded open for greater than a calibratable time. The calibratable time is necessary in order to guarantee that the propulsion bus has been fully discharged in order to prevent false failures.	Propulsion Positive Bus Voltage	> 30 Volts	Propulsion Bus Voltage Sensor  Propulsion Positive Bus Voltage  High Voltage Battery Voltage Sensor  [All Contactors OR [All Contactors AND Propulsion Bus Voltage]]	Not Failed  Not Failed  Not Failed  Open for > 120 seconds  Open  < 9 % of High Voltage Battery Voltage	4 failures out of 6 samples  12.5 ms /sample        75 ms	Type B, 2 Trips

**16 OBDG02 HPC2 (BSM) Summary Tables (Initial DTCs)**

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Hybrid Battery Negative Contactor Circuit Stuck Closed	P0AA4	The propulsion negative contactor is a high voltage relay that is used to connect the negative side of the high voltage battery to the negative side of the propulsion bus. This DTC detects when the propulsion negative contactor is stuck closed by monitoring for excessive voltage on the negative side of the propulsion bus when all contactors are commanded open for greater than a calibratable time. The calibratable time is necessary in order to guarantee that the propulsion bus has been fully discharged in order to prevent false failures.	Propulsion Negative Bus Voltage	> 30 V	Propulsion Bus Voltage Sensor	Not Failed	4 failures out of 6 samples	Type B, 2 Trips
					Propulsion Negative Bus Voltage	Not Failed	12.5 ms /sample	
					High Voltage Battery Voltage Sensor	Not Failed		
					All Contactors OR [All Contactors AND Propulsion Bus Voltage]	Open for > 120 seconds  Open  < 9 % of High Voltage Battery Voltage	75 ms

**16 OBDG02 HPC2 (BSM) Summary Tables (Initial DTCs)**

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Hybrid Battery Voltage Isolation Sensor Circuit	P0AA7	There is an Active Isolation Bias Switch to introduce an extra known resistance into the hybrid battery isolation measurement circuitry. This Active Isolation Bias Switch is used to determine active isolation resistance. This DTC verifies functionality of the switch by measuring the voltages of both Hybrid/EV Battery Pack Voltage Isolation Sensors with respect to ground while the switch is commanded on and off. Then the diagnostic monitor processes the voltage measurements through a mathematical algorithm and compares the output to a threshold value. If the output is less than the threshold value, then the Active Isolation Bias Switch is faulty.	(Hybrid/EV Battery Pack Voltage Isolation Sensor (Switch Commanded ON) - Hybrid/EV Battery Pack Voltage Isolation Sensor (Switch Commanded OFF))^2 + (Hybrid/EV Battery Pack Voltage Isolation Sensor 2 (Switch Commanded ON) - Hybrid/EV Battery Pack Voltage Isolation Sensor 2 (Switch Commanded OFF))^2	< 5 volts^2	P0AA8	DTC Not Active	12.5 ms /sample  8 seconds	Type B, 2 Trips
					P0AA9	DTC Not Active

<b>Component/ System</b>	<b>Fault Code</b>	<b>Monitor Description</b>	<b>Malfunction Criteria</b>	<b>Threshold Value</b>	<b>Secondary Parameters</b>	<b>Enable Conditions</b>	<b>Time Required</b>	<b>MIL Illum.</b>
Hybrid Battery System Voltage Low	P0AFA	This diagnostic monitors for hybrid/EV battery pack/cell voltage too low. It is a system monitor that checks the pack voltage and each cell's voltage by comparing their values against battery temperature-dependent thresholds. It can fail if either the battery pack voltage or any cell voltage is below their respective battery temperature-dependent threshold. If the voltage is below the failure threshold for sufficient time, the diagnostic will fail. For safety reasons, failures of this DTC cannot be cleared with a code clear and must be cleared by a service technician using the CPID in secondary parameters. To pass, both battery pack voltage and all cell voltages must be above their respective battery temperature-dependent thresholds.	Hybrid/EV battery pack voltage	< <b>KtBSED_U_BUV_Pac kVoltThresh</b> (V) - see Supporting Tables	No active DTCs:  DTC Clear: Must Send CPID	P0ABC  P0ABD  P0ABB  0x7E4 07 AE 32 0C 0C 00 00 00	320 failures out of 400 samples  25 ms /sample  10 s	Type A, 1 Trips

<b>Component/ System</b>	<b>Fault Code</b>	<b>Monitor Description</b>	<b>Malfunction Criteria</b>	<b>Threshold Value</b>	<b>Secondary Parameters</b>	<b>Enable Conditions</b>	<b>Time Required</b>	<b>MIL Illum.</b>
Hybrid Battery System Voltage High	P0AFB	This diagnostic monitors for hybrid/EV battery pack/cell voltage too high. It is a system monitor that checks the pack voltage and each cell's voltage by comparing their values against battery temperature-dependent thresholds. It can fail if either the battery pack voltage or any cell voltage is above their respective battery temperature-dependent threshold. If the voltage is above the failure threshold for sufficient time, the diagnostic will fail. For safety reasons, failures of this DTC cannot be cleared with a code clear and must be cleared by a service technician using the CPID in secondary parameters. To pass, both battery pack voltage and all cell voltages must be below their respective battery temperature-dependent thresholds.	Hybrid/EV battery pack voltage	> <b>KtBSED_U_BOV_PackVoltThresh</b> (V) - see Supporting Tables	No active DTCs:  DTC Clear: Must Send CPID	P0ABC  P0ABD  P0ABB  0x7E4 07 AE 32 0C 0C 00 00 00	320 failures out of 400 samples  25 ms /sample  10 s	Type A, 1 Trips
			Any hybrid/EV battery cell voltage	> <b>KtBSED_U_BOV_Cell VoltThresh</b> (V) - see Supporting Tables	No active DTCs:  DTC Clear: Must Send CPID	Cell Voltage Circuit Low (see Fault Bundle Page)  Cell Voltage Circuit High (see Fault Bundle Page)  Cell Voltage Circuit Open (see Fault Bundle Page)  0x7E4 07 AE 32 0C 0C 00 00 00	112 failures out of 140 samples  25 ms /sample  3.5 s	

**16 OBDG02 HPC2 (BSM) Summary Tables (Initial DTCs)**

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Hybrid Battery Voltage Sense A Circuit	P0B3B	This diagnostic monitors for a hybrid/ EV battery cell voltage sense line resistance which is too high (open circuit). High resistance cell sensing wires affect cell voltage sensing as well as the effectiveness of the charge-balancing functionality. The diagnostic operates the cell balancing gates in a test pattern after each normal cell voltage read in order to pull current through the sense wires and detect abnormal resistance. An increase in resistance manifests itself as an increase in voltage drop once the charge-balancing gate is closed. The voltage drop is used in a calculation and converted to resistance. If the resistance is above the failure threshold for sufficient time, the diagnostic will fail.	Calculated cell sense line resistance	> 30.00 Ω	System Voltage  No Active DTCs	> 10.20 V  U179C	7 failures out of 9 samples  100 ms /sample  900 ms	Type A, 1 Trips

Hybrid Battery Voltage Sense P Circuit High	P0B89	This diagnostic monitors for hybrid/EV battery cell voltage sensor voltage which is out of range high. It compares the sensed cell voltage against a threshold. If the voltage is above the failure threshold for sufficient time, the diagnostic will fail.	Cell voltage X	> 4.90 V	System Voltage  No Active DTCs	> 10.20 V  Cell Voltage Circuit Open (see Fault Bundle page)  U179C	14 failures out of 18 samples  100 ms /sample  1.8 s	Type A, 1 Trips

16 OBDG02 HPC2 (BSM) Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Hybrid Battery Voltage Sense Q Circuit	P0B8B	This diagnostic monitors for a hybrid/ EV battery cell voltage sense line resistance which is too high (open circuit). High resistance cell sensing wires affect cell voltage sensing as well as the effectiveness of the charge-balancing functionality. The diagnostic operates the cell balancing gates in a test pattern after each normal cell voltage read in order to pull current through the sense wires and detect abnormal resistance. An increase in resistance manifests itself as an increase in voltage drop once the charge-balancing gate is closed. The voltage drop is used in a calculation and converted to resistance. If the resistance is above the failure threshold for sufficient time, the diagnostic will fail.	Calculated cell sense line resistance	> 30.00 Ω	System Voltage  No Active DTCs	> 10.20 V  U179C	7 failures out of 9 samples  100 ms /sample  900 ms	Type A, 1 Trips

<b>Component/ System</b>	<b>Fault Code</b>	<b>Monitor Description</b>	<b>Malfunction Criteria</b>	<b>Threshold Value</b>	<b>Secondary Parameters</b>	<b>Enable Conditions</b>	<b>Time Required</b>	<b>MIL Illum.</b>
Hybrid Battery Voltage Sense Y Circuit	P0BB3	This diagnostic monitors for a hybrid/ EV battery cell voltage sense line resistance which is too high (open circuit). High resistance cell sensing wires affect cell voltage sensing as well as the effectiveness of the charge-balancing functionality. The diagnostic operates the cell balancing gates in a test pattern after each normal cell voltage read in order to pull current through the sense wires and detect abnormal resistance. An increase in resistance manifests itself as an increase in voltage drop once the charge-balancing gate is closed. The voltage drop is used in a calculation and converted to resistance. If the resistance is above the failure threshold for sufficient time, the diagnostic will fail.	Calculated cell sense line resistance	> 30.00 Ω	System Voltage  No Active DTCs	> 10.20 V  U179C	7 failures out of 9 samples  100 ms /sample  900 ms	Type A, 1 Trips

**16 OBDG02 HPC2 (BSM) Summary Tables (Initial DTCs)**

<b>Component/ System</b>	<b>Fault Code</b>	<b>Monitor Description</b>	<b>Malfunction Criteria</b>	<b>Threshold Value</b>	<b>Secondary Parameters</b>	<b>Enable Conditions</b>	<b>Time Required</b>	<b>MIL Illum.</b>
Hybrid Battery Voltage Sense AA Circuit	P1B28	This diagnostic monitors for a hybrid/ EV battery cell voltage sense line resistance which is too high (open circuit). High resistance cell sensing wires affect cell voltage sensing as well as the effectiveness of the charge-balancing functionality. The diagnostic operates the cell balancing gates in a test pattern after each normal cell voltage read in order to pull current through the sense wires and detect abnormal resistance. An increase in resistance manifests itself as an increase in voltage drop once the charge-balancing gate is closed. The voltage drop is used in a calculation and converted to resistance. If the resistance is above the failure threshold for sufficient time, the diagnostic will fail.	Calculated cell sense line resistance	> 30.00 Ω	System Voltage  No Active DTCs	> 10.20 V  U179C	7 failures out of 9 samples  100 ms /sample  900 ms	Type A, 1 Trips

<b>Component/ System</b>	<b>Fault Code</b>	<b>Monitor Description</b>	<b>Malfunction Criteria</b>	<b>Threshold Value</b>	<b>Secondary Parameters</b>	<b>Enable Conditions</b>	<b>Time Required</b>	<b>MIL Illum.</b>
Hybrid Battery Voltage Sense BL Circuit Range/ Performance	P1BA2	This diagnostic verifies that the hybrid/EV cell voltage sensor is not stuck in range. It compares changes in sensed voltage over time with other cell sensed voltages. If sufficient samples elapse with unchanging sensor's voltage while the rest of the cell voltages are trending over time, the diagnostic will fail.	Difference in cell voltage from previous data sample to present data sample	trended at least 0.002 V in the same direction as the average cell voltage trended	Absolute difference in calculated average cell voltage from previous cell voltage data sample to present cell voltage data sample  No active DTCs:	> 0.022 V  Cell Voltage Circuit Low (see Fault Bundle page)  Cell Voltage Circuit High (see Fault Bundle page)  Cell Voltage Circuit Open (see Fault Bundle page)	35 failures out of 40 evaluations	Type A, 1 Trips

**16 OBDG02 HPC2 (BSM) Summary Tables (Initial DTCs)**

<b>Component/ System</b>	<b>Fault Code</b>	<b>Monitor Description</b>	<b>Malfunction Criteria</b>	<b>Threshold Value</b>	<b>Secondary Parameters</b>	<b>Enable Conditions</b>	<b>Time Required</b>	<b>MIL Illum.</b>
Hybrid Battery Voltage Sense AG Circuit	P1E4C	This diagnostic monitors for a hybrid/ EV battery cell voltage sense line resistance which is too high (open circuit). High resistance cell sensing wires affect cell voltage sensing as well as the effectiveness of the charge-balancing functionality. The diagnostic operates the cell balancing gates in a test pattern after each normal cell voltage read in order to pull current through the sense wires and detect abnormal resistance. An increase in resistance manifests itself as an increase in voltage drop once the charge-balancing gate is closed. The voltage drop is used in a calculation and converted to resistance. If the resistance is above the failure threshold for sufficient time, the diagnostic will fail.	Calculated cell sense line resistance	> 30.00 Ω	System Voltage  No Active DTCs	> 10.20 V  U179C	7 failures out of 9 samples  100 ms /sample  900 ms	Type A, 1 Trips

Hybrid Battery Voltage Sense AS Circuit	P1E58	<p>This diagnostic monitors for a hybrid/ EV battery cell voltage sense line resistance which is too high (open circuit). High resistance cell sensing wires affect cell voltage sensing as well as the effectiveness of the charge-balancing functionality. The diagnostic operates the cell balancing gates in a test pattern after each normal cell voltage read in order to pull current through the sense wires and detect abnormal resistance. An increase in resistance manifests itself as an increase in voltage drop once the charge-balancing gate is closed. The voltage drop is used in a calculation and converted to resistance. If the resistance is above the failure threshold for sufficient time, the diagnostic will fail.</p>	Calculated cell sense line resistance	> 30.00 Ω	<p>System Voltage  No Active DTCs</p>	<p>&gt; 10.20 V  U179C</p>	<p>7 failures out of 9 samples  100 ms /sample  900 ms</p>	Type A, 1 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
		<p>cell voltages. The multiplexer may malfunction by no longer switching between the different cell voltage inputs. This would cause some battery cell voltages to go unsensed even though it does not appear so. The correct operation of the MUX is verified by using a sense wire specific current source to intrusively alter the voltage of each battery sense input in a predefined pattern. During this intrusive mode the cell voltages are monitored to verify every battery cell voltage can be observed. If a cell voltage is not altered when it should be, or is altered when it should not be, then the multiplexer is considered broken. Upon failure the test is retried a calibrated number of times. If the calibrated number of retries is exceeded, the test will fail.</p> <p>If any of these tests fail, the diagnostic will fail. If all of these tests pass, the diagnostic will pass.</p>

Hybrid Battery Interface Control Module D Cell Balancing Circuit	P1EA4	This diagnostic monitors for a hybrid/ EV battery cell balancing gate stuck open or closed. A cell balancing gate stuck open or closed affects cell voltage sensing as well as the effectiveness of the charge-balancing functionality. The diagnostic operates on the periodic input received from the hybrid/EV battery cell voltage sensors, while the cell charge-balancing gates are enabled in either an "all odd-numbered gates on" or an "all even-numbered gates on" pattern. It uses these periodic cell voltage readings, as well as the normal cell voltage readings, to create a balancing circuit ratio. If the ratio is above the failure threshold for sufficient time, the diagnostic will fail. 		<p>saturated high) The analog to digital converter output is verified that it does not have any digital bits stuck False by reading the resulting digital value when the analog input is saturated high. The input is saturated high by connecting its analog input to a voltage source which is greater than its voltage reference. After conversion the sensed voltage is compared against a threshold. If the sensed voltage is above the failure threshold for sufficient time, the test will fail.</p> <p>(Absolute value of the difference between cell voltage input and balancing switch input) The battery cell voltage sensing inputs are connected to high ohmage filter resistors. It takes very little parasitic current to create a voltage drop across the high resistance filter. This voltage drop will change the sensed voltage of the cell. Each cell voltage input is monitored for parasitic current</p>

		<p>inducing a inappropriately large voltage drop. In order to ensure that the sensed voltage isn't too affected by parasitic current we compare the battery cell voltage sensing inputs to the voltage read through the cell balancing switch inputs when the balancing switch is open. The balance switch path has no high ohmage filter resistor and thus is less impacted by parasitic current. If the absolute difference between the voltage sensed through the regular cell voltage sense inputs and the cell balancing switch inputs is above the failure threshold for sufficient time, the test will fail.</p> <p>(Voltage movement of cell voltage input under test/ Voltage movement of cell voltage inputs not under test) The battery interface control module employs a multiplexer on the cell voltage sensing inputs to need only one analog to digital converter to sense all of the battery</p>

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
		<p>cell voltages. The multiplexer may malfunction by no longer switching between the different cell voltage inputs. This would cause some battery cell voltages to go unsensed even though it does not appear so. The correct operation of the MUX is verified by using a sense wire specific current source to intrusively alter the voltage of each battery sense input in a predefined pattern. During this intrusive mode the cell voltages are monitored to verify every battery cell voltage can be observed. If a cell voltage is not altered when it should be, or is altered when it should not be, then the multiplexer is considered broken. Upon failure the test is retried a calibrated number of times. If the calibrated number of retries is exceeded, the test will fail.</p> <p>If any of these tests fail, the diagnostic will fail. If all of these tests pass, the diagnostic will pass.</p>

Hybrid/EV Battery Interface Control Module C Voltage Sensor Circuit Range/ Performance	P1FEB	The battery interface control module monitors the voltage of a group of hybrid/EV battery cells in series. This diagnostic verifies that the hybrid/EV battery pack module voltage sensor is neither inappropriately high nor low. It compares the sensed module voltage with the sum of the battery cell voltages within that module. If the absolute value of the difference between the sensed module voltage and the sum of the relevant battery cell voltages is greater than the failure threshold for sufficient time, the diagnostic will fail.	Absolute value of the difference between the module voltage and the sum of the battery cell voltages within that module	> 0.30 V	System Voltage  No Active DTCs	> 10.20 V  Cell Voltage Circuit Low (see Fault Bundle page)  Cell Voltage Circuit Open (see Fault Bundle page)  Cell Voltage Circuit High (see Fault Bundle page)  U179C	28 failures out of 35 samples  100 ms /sample  3.5 s	Type A, 1 Trips

High Voltage Battery Current	> 12.00 Amperes	High Voltage Battery Current  High Voltage Battery Voltage  Contactor Status OR Charger Contactor Status	Not Faulted  Not Faulted  Precharging	7 consecutive failed samples  12.5 ms /sample   87.50 ms to Fail  Successful Precharge to Pass	Type A, 1 Trips

### 16 OBDG02 HPC2 (BSM) Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Exhaust Heat Exchanger Bypass Valve Position Sensor Performance	P3064	This performance diagnostic detects if the valve does not function properly. If the enable criteria are met then the intrusive range-of-motion test is enabled. The valve is commanded to move from end position to end position. If the valve range of motion (end position to end position) is within a calibratable margin, then a PASS is reported. If the valve range of motion is outside the acceptable margin after a calibratable number of retries, then a FAIL is reported.	(Observed range of valve motion during the intrusive range-of-motion test  OR Observed range of valve motion during the intrusive range-of-motion test)  FOR Number of consecutive intrusive range-of-motion tests	< ( 52 - 13 ) counts           = 3	System Voltage  Engine speed  Time since last command change  ( ABS(valve position - commanded position)  OR Valve was not moved from Collect to Bypass on the previous shutdown )	> 10.20 V  > 500.00 rpm for > 5.0 sec  > 2.0 sec    > 13 counts for 20 or more out of 25 samples at 100 ms	63 sec	Type B, 2 Trips

If any data is received the diagnostic will report a pass. If no data is received for greater than a calibratable amount of time the BSM will attempt to initiate the BICMs into a communications mode where the BICMs can perform their own internal communications loop back, bypassing the daisy-chain. If this is the first BICM in the daisy-chain that the BSM cannot reestablish	Intrusive test performed upon failure of DTC U179C indicated that this is the first BICM in the communication chain with which the BSM cannot regain communication with		System Voltage  Active DTCs	> 10.20 V  U179C	5 seconds	Type A, 1 Trips
			(DTC Pass)  Intrusive test performed upon failure of DTC U179C can re-establish communication with this BICM		System Voltage  Active DTCs	> 10.20 V  U179C	100 ms	
			(DTC Pass)  U179C Pass		System Voltage	> 10.20 V	100 ms

		communication with, this diagnostic will fail.						

**16 OBDG02 HPC2 (BSM) Summary Tables (Initial DTCs)**

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Lost Communicati on with Hybrid/EV Battery Interface Control Module H	U01A7	This diagnostic monitors the UART bus communication status between the battery systems module (BSM) and the battery interface control modules (BICM). The diagnostic monitors BICM data availability whenever the communications bus is active. The communication network between BICMs and BSM is in a daisy-chain architecture, therefore a break at any point in the communication bus results in a loss of BICM communication with the BSM. If any data is received the diagnostic will report a pass. If no data is received for greater than a calibratable amount of time the BSM will attempt to initiate the BICMs into a communications mode where the BICMs can perform their own internal communications loop back, bypassing the daisy-chain. If this is the first BICM in the daisy-chain that the BSM cannot reestablish	Intrusive test performed upon failure of DTC U179C indicated that this is the first BICM in the communication chain with which the BSM cannot regain communication with		System Voltage  Active DTCs	> 10.20 V  U179C	5 seconds	Type A, 1 Trips

### 16 OBDG02 MCP1A Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Sensor Power Supply A Circuit Low	P06B1	This diagnostic monitors the IGBT power supply circuit voltage. The sensed voltage is compared against a threshold. If the sensed voltage is below the failure threshold for sufficient time, the diagnostic will fail.	Scaled 15V IGBT Supply Voltage	< 12.00 V	Wakeup Signal	ON	0.34 seconds out of a 0.42 seconds window (x of y)  OR  Continuous Fail Time > 0.30 seconds	Type A, 1 Trips

**16 OBDG02 MCP1A Summary Tables (Initial DTCs)**

<b>Component/ System</b>	<b>Fault Code</b>	<b>Monitor Description</b>	<b>Malfunction Criteria</b>	<b>Threshold Value</b>	<b>Secondary Parameters</b>	<b>Enable Conditions</b>	<b>Time Required</b>	<b>MIL Illum.</b>
Sensor Power Supply A Circuit High	P06B2	This diagnostic monitors the IGBT power supply circuit voltage. The sensed voltage is compared against a threshold. If the sensed voltage is above the failure threshold for sufficient time, the diagnostic will fail.	Scaled 15V IGBT Supply Voltage	> 22.00 V	Wakeup Signal	ON	0.34 seconds out of a 0.42 seconds window (x of y)  OR  Continuous Fail Time > 0.30 seconds	Type A, 1 Trips

**16 OBDG02 MCP1A Summary Tables (Initial DTCs)**

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Drive Motor A Control Module Performance	P0A1B	<p>This Diagnostic tests all the internal processor subsystems for faults which suggest that the integrity of the processor can not be trusted.</p> <p>Fail Case 1:</p> <p>In case of many faults the MCP microprocessor along with the other microprocessors need to take remedial action to directly take the vehicle to a safe state. This fail case tests at powerdown that the microprocessors can take those remedial actions effectively. Potential failures can include memory, software, processor and ALU faults. The diagnostic runs by setting different controller inputs and the outputs are checked in each case across all of the microprocessors . The DTC sets when the outputs are not as expected for the indicated number of tests.</p> <p>Fail Case 2, 3, 4, 5, 6:</p>	<p>Inhibit Path Test Failed</p> <p>Indicates that the Processor is not demonstrating the ability to inhibit the system (take remedial action) during the Inhibit Path Test</p> <p>"2ndFailsToTakeRmdlActn"</p>	>= 3 Failures	<p>HV Batt contactor Staus Available</p> <p>Invertor State</p> <p>HV Batt Voltage</p> <p>HV Contactors</p> <p>12V Batt Voltage</p> <p>Vehicle Speed</p> <p>Motor Faults</p> <p>Motor Speed</p> <p>SRAR Shutdowns</p> <p>SPI Fault</p> <p>RunCrank Active</p> <p>Ram or ROM fault</p> <p>Seed received in wrong order fault</p> <p>Seed/Key Timeout</p> <p>Powermode Off time</p>	<p>= TRUE</p> <p>= Off</p> <p>&gt;= 80.00 V</p> <p>= Closed</p> <p>&gt; 9.50 V</p> <p>&lt; 0.00 kph</p> <p>= FALSE (None active)</p> <p>&lt;= 10.00 rpm</p> <p>= FALSE</p> <p>= FALSE (No active P0606)</p> <p>= FALSE</p> <p>= FALSE (No active P0601, P0604)</p> <p>= FALSE (No active P0606)</p> <p>= FALSE</p> <p>&lt; 5.00 s</p>	<p>Executes in a 12.5ms loop</p> <p>Increment/ Decrement counter = 3</p>	Type A, 1 Trips
			<p>Key Value</p> <p>Indicates that the Processor received incorrect key values for the associated seed values that it sent out to the secondary processor</p>	≠ expected key value	<p>Number Of Mains Processors to monitor</p> <p>IPT status</p> <p>SPI Fault</p>	<p>&gt; 0</p> <p>= Not Running</p> <p>= FALSE (No active P0606)</p>	<p>Executes in a 12.5ms loop</p> <p>Detects in 150ms or two consecutive faulty keys</p>

		<p>The microprocessors in the TPIM ECU monitor that each of the others is executing code correctly and in a timely manner. These fail cases rely on a seed and key interaction where one micro-controller sends a seed and a second controller runs a predefined set of calculations and responds with a key. The first controller sends a seed and checks that the received key matches its lookup table value for that seed and that it was received in time. The second controller checks that the correct seed value has been received and that is in time. The DTC sets when there is a mismatch of seed or key values or the expected key or seed value is out of order or if the key or seed value has not been received in the indicated time.</p> <p>Fail Case 7, 8, 9:</p> <p>These diagnostics are built into the hardware of the MCP microprocessor by the</p>	"2ndRxIncorrectKeys"		Run/Crank Voltage	>= 9.50 V

### 16 OBDG02 MCP1A Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Drive Motor A Position Sensor Circuit	P0A3F	This diagnostic monitors the output from the resolver circuit on the high voltage motor. The circuit observes the error between the sin and cos signals produced by the operation of the resolver. If the error is below a threshold voltage the circuit will output a status signal indicating a loss of signal. If the loss of signal status is present for a threshold amount of time, the diagnostic will fail.	Amplitude of Sin or Cos Signal	<2.3V	Wakeup Signal  Resolver Initialization Delay  Once Resolver has indicated a fault, a Retry timer is initiated. Retry Timer must be	ON  1.00 s  > 0.05 s	Failure Conditions Met for 0.20 to 0.40 seconds out of a 2.00 second window	Type A, 1 Trips

<b>Component/ System</b>	<b>Fault Code</b>	<b>Monitor Description</b>	<b>Malfunction Criteria</b>	<b>Threshold Value</b>	<b>Secondary Parameters</b>	<b>Enable Conditions</b>	<b>Time Required</b>	<b>MIL Illum.</b>
Drive Motor "A" Phase W Current Sensor Offset Out-of Range	P0BEE	This diagnostic monitors the offset that is learned by the phase "W" current sensor on the high voltage electric motor. In order to ensure accurate current measurement an offset is calculated when there is no current going through the motor. The offset learn process is conducted on every key crank, the learned offset is then compared against a threshold, if the offset value is larger than the fail threshold the diagnostic will fail.	W phase current sensor offset learn value	> 30.00 amps	Wakeup Signal  Delay Timer  Motor Faults  Inverter Faults	On  0.10 Sec  None  None	Fail conditions met 0.10 sec after enable conditoinis met	Type A, 1 Trips

Drive Motor "A" Phase U- V-W Correlation	P0BFD	This diagnostic monitors the U, V, and W phase currents for balance. The absolute value of the sum of the phase values is compared against a threshold. If the sum is above the failure threshold for sufficient time, the diagnostic will fail.	Sum of U-V-W phase currents	≥ 110.00 amps	Wakeup Signal  Run Flag	On  = 1.00	0.0032 seconds out of a 0.0038 seconds window (x of y)	Type A, 1 Trips

16 OBDG02 MCP1A Summary Tables (Initial DTCs)

Component/System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Drive Motor "A" Phase U-V-W Current Sensor Overcurrent	P0C01	This diagnostic monitors the sensed current on all three phases of the electric motor. The absolute value of the highest current phase value is then compared against a threshold. If the value is above the failure threshold for sufficient time, the diagnostic will fail. This diagnostic implements the use of 2 different fail timers, one fast and one slow. The fast timer has a very short sample window so that the diagnostic will detect a sudden fault, the slower timer has a longer sample window to allow the diagnostic to detect an intermittent fault.	U, V, or W Phase Current Sensor	> 600.00 amps	Wakeup Signal	On	0.0104 seconds out of a 0.104 seconds window (x of y)  OR  0.00416 seconds out of a 0.0208 seconds window (x of y)	Type A, 1 Trips
			D Axis current less than calculated threshold determined by stator temperature listed in supporting table unless the motor temperature reading is faulted, then D Axis current threshold is determined by a default value	D-Axis Current<- 600.00 amps (faulted motor temp value)  <b>P0C01 D-Axis Current Thresholds</b> (See supporting tables for expected threshold values for non-faulted motor temperature readings)	Wakeup Signal	On	0.0104 seconds out of a 0.104 seconds window (x of y)  OR  0.00416 seconds out of a 0.0208 seconds window (x of y)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Drive Motor A Position Sensor Not Learned	P0C17	This diagnostic monitors the initial offset that is learned by the resolver circuit. The diagnostic runs only when there is no previously stored value for the resolver offset. The diagnostic fails when during the learn process either the motor speed is higher than a threshold, the total high voltage bus is below a threshold voltage, the peak to peak current on the motor falls below a threshold, or the learn process takes longer than a threshold time.	Initial Offset Learn Could Not Complete Because: ABS(Motor Speed)	> 50.00 rpm	Key Off	TRUE	0.30 s Learn Time	Type A, 1 Trips
			Initial Offset Learn Could Not Complete Because: Filtered DC	< 200.00 V	Key Off	TRUE	0.30 s Learn Time	
			Initial Offset Learn Could Not Complete Because: ALL phase Current	< 30.00 A	Key Off	TRUE	0.30 s Learn Time	
			Initial Offset Learn Could Not Complete Because: Learn Timer	> 1.40 s	Key Off	TRUE	0.30 s Learn Time	

### 16 OBDG02 MCP1A Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Drive Motor A Torque Delivered Performance	P0C19	This diagnostic is a plausibility check that the motor torque is following the commanded torque. Potential failure modes include the motor's ability to produce torque and the torque calculation path in the microprocessor. When the difference between commanded motor torque and actual motor torque is greater than the indicated threshold for longer than the timer threshold, the DTC is set.	Absolute value of (Commanded torque - Torque Command Slewed)	> 123.00 Nm	DTCs not Fault Active AND  DTCs not Fault Active AND  Motor Drive State ID AND  ((DTCs not Fault Active) OR (Voltage Hazard Active AND Motor Temperature Fault Active))	(P1AF5 or P1B0C or P1B41)  (P0A3F or P0A40 or P1B03 or P16EB)  = Run  P0BFD  = True  = False	0.1875 seconds out of a 0.2 seconds window	Type A, 1 Trips

<b>Component/ System</b>	<b>Fault Code</b>	<b>Monitor Description</b>	<b>Malfunction Criteria</b>	<b>Threshold Value</b>	<b>Secondary Parameters</b>	<b>Enable Conditions</b>	<b>Time Required</b>	<b>MIL Illum.</b>
Drive Motor A Position Exceeded Learning Limit	P0C4E	This diagnostic monitors the offset that is learned by the resolver circuit. The diagnostic runs on every key off cycle after the offset learn has completed. Once the offset value has been determined it is compared to a threshold. If the value of the offset is above the fail threshold, the diagnostic will fail. Another way the diagnostic can fail is once the offset learn has completed and the offset value determined, it is then compared against the previously stored offset value. If the absolute value of the difference between the previous offset value and the current offset value is above the failure threshold the diagnostic will fail.	Offset Learn Completes AND ABS(Offset Correction Angle)	> 30.00 degrees	Key Off  Offset Learn Status	TRUE  Complete	5.00 key off cycles of out of offset angle being out of range	Type A, 1 Trips
			Offset Learn Completes AND ABS(Offset Correction Angle - previously stored value)	> 10.00 degrees	Key Off  Offset Learn Status	TRUE  Complete	5.00 key off cycles of out of offset angle being out of range

<b>Component/ System</b>	<b>Fault Code</b>	<b>Monitor Description</b>	<b>Malfunction Criteria</b>	<b>Threshold Value</b>	<b>Secondary Parameters</b>	<b>Enable Conditions</b>	<b>Time Required</b>	<b>MIL Illum.</b>
Drive Motor A Position Sensor Circuit Loss of Tracking	P1B03	This diagnostic monitors the output from the resolver circuit on the high voltage motor. The circuit is continually calculating the position of the rotor in degrees. When the error between each sampling of position is greater than 5 degrees the circuit will output a status signal indicating a loss of tracking. If the loss of tracking status is present for a threshold amount of time, the diagnostic will fail.	Internal Tracking Error	>5 Degrees	Wakeup Signal  Resolver Initialization Delay  Once Resolver has indicated a fault, a Retry timer is initiated. Retry Timer must be	ON  1.00  > 0.05 s	Failure Conditions Met for 0.20 to 0.40 seconds out of a 2.00 second window	Type A, 1 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Drive Motor A Position Sensor Circuit Overspeed	P1B0D	This diagnostic monitors the output speed of the high voltage motor. The absolute value of the sensed speed of the motor is compared against a threshold. If the sensed speed is above the fail threshold for sufficient time, the diagnostic will fail.	ABS(Motor Speed)	> 12,700.00 rpm	Wakeup Signal	On	0.09 seconds out of a 0.1 seconds window (x of y)	Type A, 1 Trips

### 16 OBDG02 MCP1A Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Drive Motor A Position Sensor Learn Incorrect	P1B0F	This diagnostic monitors the offset that is learned by the resolver circuit. The diagnostic runs on every key off cycle while the offset learn process is in progress. The offset learn process can fail when during the learn process either the motor speed is higher than a threshold, the total high voltage bus is below a threshold voltage, the peak to peak current on the motor falls below a threshold, or the learn process takes longer than a threshold time. If the learn process fails for any one of the aforementioned reasons a counter is increased and compared against a threshold. If the counter exceeds the threshold the diagnostic will fail.	Offset Learn Could Not Complete Because:		Key Off	TRUE	15.00 consecutive key cycles with a 0.30 s Learn Time	Type B, 2 Trips
			ABS(Motor Speed)	> 50.00 rpm				
			Consecutive Key Cycles where the offset learn is unable to complete	> 15.00 cycles				
			Initial Offset Learn Could Not Complete Because:		Key Off	TRUE	15.00 consecutive key cycles with a 0.30 s Learn Time	
Filtered DC	< 200.00 V							
Consecutive Key Cycles where the offset learn is unable to complete	> 15.00 cycles							
Initial Offset Learn Could Not Complete Because:		Key Off	TRUE	15.00 consecutive key cycles with a 0.30 s Learn Time				
ALL phase Current	< 30.00 A							
Consecutive Key Cycles where the offset learn is unable to complete	> 15.00 cycles							
Initial Offset Learn Could Not Complete Because:		Key Off	TRUE	15.00 consecutive key cycles with a 0.30 s Learn Time				
Learn Timer	> 1.40 s							
Consecutive Key Cycles where the offset learn is unable to complete	> 15.00 cycles

<b>Component/ System</b>	<b>Fault Code</b>	<b>Monitor Description</b>	<b>Malfunction Criteria</b>	<b>Threshold Value</b>	<b>Secondary Parameters</b>	<b>Enable Conditions</b>	<b>Time Required</b>	<b>MIL Illum.</b>
Drive Motor B Position Sensor Circuit Overspeed	P1B0E	This diagnostic monitors the output speed of the high voltage motor. The absolute value of the sensed speed of the motor is compared against a threshold. If the sensed speed is above the fail threshold for sufficient time, the diagnostic will fail.	ABS(Motor Speed)	> 12,700.00 rpm	Wakeup Signal	On	0.09 seconds out of a 0.1 seconds window (x of y)	Type A, 1 Trips

**16 OBDG02 MCP2B Summary Tables (Initial DTCs)**

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Drive Motor B Position Sensor Learn Incorrect	P1B10	This diagnostic monitors the offset that is learned by the resolver circuit. The diagnostic runs on every key off cycle while the offset learn process is in progress. The offset learn process can fail when during the learn process either the motor speed is higher than a threshold, the total high voltage bus is below a threshold voltage, the peak to peak current on the motor falls below a threshold, or the learn process takes longer than a threshold time. If the learn process fails for any one of the aforementioned reasons a counter is increased and compared against a threshold. If the counter exceeds the threshold the diagnostic will fail.	Offset Learn Could Not Complete Because:		Key Off	TRUE	15.00 consecutive key cycles with a 0.30 s Learn Time	Type B, 2 Trips
			ABS(Motor Speed)	> 50.00 rpm				
			Consecutive Key Cycles where the offset learn is unable to complete	> 15.00 cycles				
			Initial Offset Learn Could Not Complete Because:		Key Off	TRUE	15.00 consecutive key cycles with a 0.30 s Learn Time	
Filtered DC	< 200.00 V							
Consecutive Key Cycles where the offset learn is unable to complete	> 15.00 cycles							
Initial Offset Learn Could Not Complete Because:		Key Off	TRUE	15.00 consecutive key cycles with a 0.30 s Learn Time				
ALL phase Current	< 30.00 A							
Consecutive Key Cycles where the offset learn is unable to complete	> 15.00 cycles							
Initial Offset Learn Could Not Complete Because:		Key Off	TRUE	15.00 consecutive key cycles with a 0.30 s Learn Time				
Learn Timer	> 1.40 s							
Consecutive Key Cycles where the offset learn is unable to complete	> 15.00 cycles

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Drive Motor "B" Phase U- V-W Correlation	P0BFE	This diagnostic monitors the U, V, and W phase currents for balance. The absolute value of the sum of the phase values is compared against a threshold. If the sum is above the failure threshold for sufficient time, the diagnostic will fail.	Sum of U-V-W phase currents	≥ 110.00 amps	Wakeup Signal  Run Flag	On  = 1.00	0.0032 seconds out of a 0.0038 seconds window (x of y)	Type A, 1 Trips

16 OBDG02 MCP2B Summary Tables (Initial DTCs)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Drive Motor "B" Phase U- V-W Current Sensor Overcurrent	P0C04	This diagnostic monitors the sensed current on all three phases of the electric motor. The absolute value of the highest current phase value is then compared against a threshold. If the value is above the failure threshold for sufficient time, the diagnostic will fail. This diagnostic implements the use of 2 different fail timers, one fast and one slow. The fast timer has a very short sample window so that the diagnostic will detect a sudden fault, the slower timer has a longer sample window to allow the diagnostic to detect an intermittent fault.	U, V, or W Phase Current Sensor	> 600.00 amps	Wakeup Signal	On	0.0104 seconds out of a 0.104 seconds window (x of y)  OR  0.00416 seconds out of a 0.0208 seconds window (x of y)	Type A, 1 Trips
			D Axis current less than calculated threshold determined by stator temperature listed in supporting table unless the motor temperature reading is faulted, then D Axis current threshold is determined by a default value	D-Axis Current<- 600.00 amps (faulted motor temp value)  <b>P0C01 D-Axis Current Thresholds</b> (See supporting tables for expected threshold values for non-faulted motor temperature readings)	Wakeup Signal	On	0.0104 seconds out of a 0.104 seconds window (x of y)  OR  0.00416 seconds out of a 0.0208 seconds window (x of y)	

**16 OBDG02 MCP2B Summary Tables (Initial DTCs)**

<b>Component/ System</b>	<b>Fault Code</b>	<b>Monitor Description</b>	<b>Malfunction Criteria</b>	<b>Threshold Value</b>	<b>Secondary Parameters</b>	<b>Enable Conditions</b>	<b>Time Required</b>	<b>MIL Illum.</b>
Drive Motor B Inverter Power Supply Circuit/Open	P0C0E	This diagnostic monitors the status of the IGBTs. The IGBT module will continuously monitor the supply circuit voltage. When the supply circuit drops below a threshold voltage the module then report out a status of being in a Bias fault. If the Bias fault status is present for sufficient time, the diagnostic will fail.	Phase A, B, or C Power Supply	Failed (Status Fault Bit)	Inverter State	Initialization Complete	0.002 seconds out of a 0.024 seconds window (x of y)	Type A, 1 Trips

**Initial Supporting table - P0C01 D-Axis Current Thresholds****Description:** X-Axis is stator temperature, Y-Axis is current threshold for the D-Axis current**Notes:**

y/x	100	120	140	150	160	200	250	300	400	500
1	-539	-482	-404	-337	-310	-310	-310	-310	-310	-310

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
ABS Front Hydraulic Circuit Leak Detected	C05B0	This monitoring checks if the front brake circuit has a leak by comparing the wheels dynamics with the vehicle deceleration.1. A fault is set if wheels dynamics do not match the vehicle deceleration.	The wheels dynamics are not matching the vehicle deceleration	= True	Ignition key AND Antilock brake system OR EBD Braking	= On  = Active  = Active	1 [Sec]	Type A, 1 Trip
		This monitoring checks for a brake circuit failure at the front axle. A fault is set if the master cylinder pressure is higher than the rear axle pressure.	Pressure of Master cylinder	> Pressure of rear axle	Ignition key AND Pressure at front axle Maintain the brake pedal at a constant force	= On  > 5000 Kpa = 3 Sec	0.2 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition On and apply brake pedal with a pressure at front axle higher than 5000 kpa. Maintain the brake pedal with a constant force for 3 seconds and release.					
ABS Pump Motor Calibration Not Learned	C05AE	This monitoring strategy checks if there is a 0V calibration at Sigma Delta Modulator (SDM). The motor measuring units through a SDM require a 0V calibration. The measured SDM 0V calibration values are compared. A fault is set if the measured voltages are outside of a calibrated range.	Raw generator voltage Ugen OR Raw generator voltage Ugen AND Raw voltage drops at hydraulic pump motor relay URdsON OR Raw voltage drops at hydraulic pump motor relay URdsON	< 14 V  > 23.8 V  < 13 V  > 18 V	Ignition key AND System voltage AND Hydraulic pump motor	= On  > 6.9 V  = Off	3 [Sec]	Type A, 1 Trip
		This monitoring verifies the supply voltage of the return flow pump. A supply undervoltage fault is set if the voltage of the pump motor shunt resistor is below a calibrated threshold or if the voltage of the Motor relay drain voltage is above a calibrated range, which is depending on the system voltage.	Voltage of motor shunt resistor OR Motor relay drain voltage OR Motor relay drain voltage	< 7.5 V  > 3 V  < 1.5 V	Ignition key AND System voltage AND Hydraulic pump motor	= On  > 6.9 V  = Off	2 [Sec]	Type A, 1 Trip
		DTC Pass	Accelerate vehicle to at least 18.6 mph and hold the speed for at least 20s					
ABS Pump Motor Control Circuit High	C052D	This monitoring strategy checks if there is a motor interruption or a motor relay short-circuit failure outside a motor actuation. The state of the pump motor is monitored. A fault is set if the motor voltage exceeds a calibrated threshold.	Hydraulic pump motor supply voltage	> 12 V	Hydraulic pump motor	= Off	1 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 30sec without braking.					

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
ABS Pump Motor Performance	C052B	This monitoring strategy checks if the return pump is weak due to a heavy load. A fault is set if the calculated generator voltage is over a calibrated threshold and the measured generator voltage is below the same threshold.	Calculated generator voltage AND Measured generator voltage	> 0.6 V  < 0.6 V	System voltage AND Hydraulic pump motor AND Electronic Brake Control Unit state	> 6.9 V  = On  = Started with hardware reset	0.48 [Sec]	Type A, 1 Trip
		This monitoring strategy checks the functionality of the hydraulic pump motor path. A fault is set if the voltage drop over the motor relay stays below a calibrated threshold when the motor relay (MR) is switched on.	Voltage drops at hydraulic pump motor relay AND Motor relay switched on	< 2 V  = True	System voltage AND Vehicle speed AND Hydraulic pump motor	> 6.9 V  > 9.32 mph  = Off	5 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the hydraulic pump motor can be actuated and if the generated motor voltage is visible to the microcontroller. The pump motor is actuated, and both the analog and digital feedback voltage signals are monitored. A fault is set if the analog or digital pump motor voltage is below a calibrated threshold.	Analog pump motor voltage OR Digital pump motor voltage	< 1.7 V  < 1.7 V	Ignition key	= On	5 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the motor voltage is incorrect. The Motor Voltage Comparison Test triggers a predetermined number of measurements in normal mode to give the motor voltage comparison monitor the chance to detect failures. To do this, it switches the motor voltage to UBMR (Battery Motor Relay) voltage and compares the analog UBMR voltage read in by the Analog Digital Converter (ADC) with the digital UBMR voltage calculated by the Application Specific Integrated Circuit (ASIC) while the hydraulic pump is not active. A fault is set if the deviation between the UBMR voltage read by the ADC (analog) and the UBMR voltage calculated by the ASIC (digital) exceeds a calibrated threshold.	Motor relay supply line voltage read by ADC (analog) / Motor relay supply line voltage calculated by ASIC (digital)	> 0.25	Ignition key AND Hydraulic pump motor	= On  = On	2 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 30sec without braking. Accelerate vehicle to at least 37.3 mph and hold the speed for at least 7s					
ABS Pump Motor Supply Circuit	C052F	This monitoring strategy checks if an interruption of the motor relay voltage supply line has occurred. This can be caused by a defective fuse, a bad or broken car wire harness, or even by very deep undervoltage at the motor relay voltage supply line. A fault is set if the supply line voltage (UBMR) drops below a calibrated threshold.	Motor relay supply voltage	< 1.955 V	Ignition key	= On	0.1 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
ABS Pump Motor Supply Voltage "A" Circuit Low	C055B	This monitoring strategy checks if there is a possible inline resistor or undervoltage situation in the motor relay supplier. This is a check to ensure that the Application Specific Integrated Circuit (ASIC) register bit is set whenever there is an MRDSupplyFailure and is not reset throughout the ignition cycle, even if the voltage is recovered. A fault is set if during return flow pump actuation, the motor relay battery voltage drops below a calibrated threshold.	Motor relay voltage / internal supply voltage	< 0.4	Hydraulic pump motor AND Ignition key AND Vehicle speed	= On  = On  > 23.6 mph	0.01 [Sec]	Special Type C
		This monitoring strategy checks if there are failures on the motor supply line (for example: interruptions of UBMR). An Application Specific Integrated Circuit (ASIC) compares the voltage at UBMR with an internal dependent threshold provided by the hardware. A fault is set if the motor relay supply voltage is below a calibrated threshold.	Motor relay voltage / internal supply voltage	< 0.4	Ignition key	= On	0.2 [Sec]	Special Type C
		DTC Pass	Drive off, accelerate up to 37.2 mph and maintain this speed for at least 5 Sec					
ABS Rear Hydraulic Circuit Leak Detected	C05B1	This monitoring strategy checks if there is a leakage on the rear axle brake circuit. The monitor detects the variation of the rear axle pressure value during hold phases. A fault is set if the rear axle pressure decreases by more than a calibrated amount.	Calculated leakage on rear axle from the pressure variation	> 0.3 ml/Sec	System voltage Rear axle target pressure Pump motor running Vehicle speed For a cumulative duration of braking situations	> 9.6 V  > 4500 kPa = False = 0 mph > 300 Sec	1[Sec]	Type A, 1 Trip
		This monitoring checks for a brake circuit failure at the rear axle. A fault is set if the master cylinder pressure is lower than the rear axle pressure.	Pressure of Master cylinder	< Pressure of rear axle	Ignition key AND Pressure at front axle Maintain the brake pedal at a constant force	= On  > 5000 KPa = 3 Sec	0.2 [Sec]	Type A, 1 Trip
		DTC Pass	Turn on ignition. Constant brake pedal application during standstill for at least 3 sec. Check that the brake lights are illuminated or pressure at master cylinder > 500kpa. Release the brake pedal. Wait 5s. Constant brake pedal application during standstill for at least 3 sec. Check that the brake lights are illuminated or pressure at master cylinder > 500kpa. Release the brake pedal.					

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Brake Assist Information 1 Message Counter Incorrect	C1284	This monitoring strategy checks whether the message is still alive or not. The network driver has to send and receive all network messages. At the same time it has to check that the messages are correct (length, checksum, alive-counter, reception timeout). With each newly sent message a counter is incremented within the sending ECU. the counter value is enclosed within the message. The receiving control unit checks whether counters have been incremented. A fault is set if the counter value is not incremented.	Message 0x214 on Bus E counter halted	= True	System voltage AND System voltage AND Bus Off Fault Active ECU is sending/receiving on CAN AND ECU Power Mode transition diagnostic enable delay timer	> 7.5 V  < 16 V  = False = True  ≥ 5 Sec	0.1 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the message checksum is correct. The network driver sends and receives all network messages. It also checks if the messages are correct (length, checksum, alive-counter, reception timeout). With each newly sent message a checksum is calculated within the sending ECU. The value of the checksum is enclosed within the message. The receiving control unit calculates the checksum again and compares it with the sent one. A fault is set if the received checksum is different from the calculated checksum.	Checksum of 0x214 on Bus E not correct	= True	System voltage AND System voltage AND Bus Off Fault Active ECU is sending/receiving on CAN AND ECU Power Mode transition diagnostic enable delay timer	> 7.5 V  < 16 V  = False = True  ≥ 5 Sec	0.1 [Sec]	Type A, 1 Trip
Brake Assist Information 2 Message Counter Incorrect	C1285	This monitoring strategy checks whether the message is still alive or not. The network driver has to send and receive all network messages. At the same time it has to check that the messages are correct (length, checksum, alive-counter, reception timeout). With each newly sent message a counter is incremented within the sending ECU. the counter value is enclosed within the message. The receiving control unit checks whether counters have been incremented. A fault is set if the counter value is not incremented.	Message 0x219 on Bus E counter halted	= True	System voltage AND System voltage AND Bus Off Fault Active ECU is sending/receiving on CAN AND ECU Power Mode transition diagnostic enable delay timer	> 7.5 V  < 16 V  = False = True  ≥ 5 Sec	0.1 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Brake Blending System Performance	C05AD	This monitoring tests if the actual pressure in the boost piston is much higher than the target pressure. The cause of this fault could be an erroneously high pressure sensor value. A fault is set if the actual pressure is much higher than the target pressure in the by-wire circuit	Actual pressure	> 4000 KPa	Ignition key	= On	0,5 - 1 [Sec]	Type A, 1 Trip
		This monitoring tests if the actual pressure in the boost piston is much higher than the target pressure. The cause of this fault could be an erroneously high pressure sensor value. A fault is set if the actual pressure is much higher than the target pressure in the master cylinder.	Actual pressure	> 4000 KPa	Ignition key	= On	0,5 - 1 [Sec]	Type A, 1 Trip
		This monitoring checks if the actual pressure in the boost piston is much lower than the target pressure. The cause of this fault could be an erroneously low pressure sensor value, no pressure or too low pressure in the accumulator, a defective pump, air in the hydraulic circuit, or a leakage in the hydraulic circuit. A fault is set if the actual pressure is much lower than the target pressure in the by-wire circuit	Actual pressure	< 1500 KPa	Ignition key	= On	0,5 - 1 [Sec]	Type A, 1 Trip
		This monitoring checks if the actual pressure in the boost piston is much lower than the target pressure. The cause of this fault could be an erroneously low pressure sensor value, no pressure or too low pressure in the accumulator, a defective pump, air in the hydraulic circuit, or a leakage in the hydraulic circuit. A fault is set if the actual pressure is much lower than the target pressure in the master cylinder.	Actual pressure	< 1500 KPa	Ignition key	= On	0,5 - 1 [Sec]	Type A, 1 Trip
		DTC Pass	Turn on ignition, 1. Wait 5seconds, 2. Drive up to 24.8 mph, 3. Realize a comfortable braking (about 3000 kpa at the rear axle), 4. Hold for 2 seconds and release smooth the brake pedal, 5. Wait 2seconds. Then repeat step 2 to 5 once again.					
Brake Master Cylinder Pressure Sensor 1 Circuit High Voltage	C0572	This monitoring checks if there is a short circuit between the supply voltage line and the pressure sensor signal line by comparing the signal line with the supply voltage line. Normally, the signal line maximum voltage should be lower than the supply voltage. A fault is set, if there is no difference in voltage between the signal line and the supply line.	Signal line voltage / Supply line voltage AND Signal line voltage / Supply line voltage	> 0.95  < 1.05	Ignition key	= On	0.1 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Brake Master Cylinder Pressure Sensor 1 Circuit Low Voltage	C0571	This monitoring checks if there is a short circuit between the ground and the pressure sensor signal line by comparing the signal line voltage with the ground. Normally, the signal line has a minimum voltage that is higher than the ground. A fault is set if there is no difference in voltage between the signal line and the ground.	Signal line voltage / Ground voltage AND Signal line voltage / Ground voltage	> 0.95  < 1.05	Ignition key	= On	0.1 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Brake Master Cylinder Pressure Sensor 1 Circuit Performance	C0574	This monitoring strategy checks if the offset compensation of the pressure sensor is out of range. The zero-point of the pressure sensor signal is adjusted to compensate for any signal drifts. The offset compensation is only performed when the brake pedal is not applied (corresponding to the pressure sensor zero point). A fault is set if the offset is outside a calibrated range.	Measured pressure OR Measured pressure	> 1500 KPa  < -1500 KPa	System voltage AND Brake pedal is pushed AND Acceleration pedal is pushed AND Hydraulic pump motor And Vehicle speed	> 6.9 V  = False  = True  = Off  > 4.48 mph	Immediately	Type A, 1 Trip
		DTC Pass	Drive off, accelerate up to 37.2 mph and maintain this speed for at least 5s					
Brake Pressure Sensor "A" Missing Calibration	C0560	This monitoring strategy checks if the pressure sensor at the master cylinder is functioning as expected. A fault is set if the master cylinder pressure sensor test pulse voltage exceeds a calibrated threshold or if it falls below another calibrated threshold.	Master cylinder pressure sensor test pulse voltage OR Master cylinder pressure sensor test pulse voltage	> 110 %  < 90 %	Vehicle acceleration AND Actual pressure of Master Cylinder AND Traction Control System AND Vehicle speed AND Anti-Lock Braking System intervention AND Vehicle Dynamics Control AND Hydraulic pump motor	= False  < 150 KPa  = Off  < 9.32 mph  = Off  = Off  = Off	Immediately	Type A, 1 Trip
		DTC Pass	Drive with more than 6.2 mph for more than 60 Sec. without pressing brake pedal and no					

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Brake Pressure Sensor "B" Missing Calibration	C059B	This monitoring strategy checks if the rear left pressure sensor is functioning as expected. A fault is set if the master cylinder pressure sensor test pulse voltage exceeds a calibrated threshold. A fault is also set if the test pulse voltage falls below a calibrated threshold.	Rear left pressure sensor testpulse voltage OR Rear left pressure sensor testpulse voltage	> 110 %  < 90 %	System Software Offset compensation of pressure sensor completed AND Actual pressure of Master Cylinder AND Traction Control System AND Anti-Lock Braking System intervention AND Vehicle Dynamics Control AND Hydraulic pump motor AND Brake light switch AND Last test pulse AND Vehicle speed OR Throttle control is pushed	= At least once  < 150 kPa  = Off  = Off  = Off  = Off  = Off  > 30 Sec  < 9.32 mph  = True	Immediately	Type A, 1 Trip
		DTC Pass	Drive with more than 6.2 mph for more than 60 Sec. without pressing brake pedal and no stability control active.					
Brake Pressure Sensor / Brake Pedal Position Sensor Correlation	P05FF	This monitoring checks for hydraulic circuit failures. It will check if there is a leakage or a large amount of air in the hydraulic circuit. A fault is set if the pressure sensor value stay at zero while the pedal Travel sensor value is over a threshold.	PTS signal AND Pressure signal	> 24 mm  = 0 KPa	Full system mode	= On	0.2 [Sec]	Type A, 1 Trip
		This monitoring checks a pressure sensor plausibility failure. A fault is set if the pressure sensor value is too high compared to the pedal travel sensor value.	PTS signal AND Pressure signal	= 0 mm  > 25 KPa	Full system mode	= On	0.2 [Sec]	Type A, 1 Trip
		DTC Pass	The brake pedal has to be pressed for more than 1 second (the pressure should reach minimum 3000 kpa).					

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Control Module Communication Chassis Expansion CAN Bus Off - Generic	U0077	The CAN (Control Area Network) bus E state is monitored periodically. A fault is set if the bus is in "Bus Off" state.	CAN bus E state	= Bus off	System voltage AND System voltage ECU is sending/receiving on CAN AND ECU Power Mode transition diagnostic enable delay timer	> 7.5 V  < 16 V = True  ≥ 5 Sec	0.09 [Sec]	Type A, 1 Trip
		This monitoring checks the CAN initialization function has taken too long to finish. The access to message Ram by the CAN-Core is handled through a message interface register. In each cycle a CAN register bit is checked to determine if the bit is set. A fault is set if the loop lasts longer than a threshold	Number of CAN cycles	> 1000	Ignition key	= On	0.01 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 30sec without braking.					
Control Module Communication High Speed CAN Bus Off - Generic	U0073	The CAN (Control Area Network) bus A state is monitored periodically. A fault is set if the bus is in "Bus Off" state.	CAN bus A state	= Bus off	System voltage AND System voltage ECU is sending/receiving on CAN AND ECU Power Mode transition diagnostic enable delay timer	> 7.5 V  < 16 V = True  ≥ 5 Sec	0.24 [Sec]	Type A, 1 Trip
		This monitoring checks the CAN initialization function has taken too long to finish. The access to message Ram by the CAN-Core is handled through a message interface register. In each cycle a CAN register bit is checked to determine if the bit is set. A fault is set if the loop lasts longer than a threshold	Number of CAN cycles	> 1000	Ignition key	= On	0.01 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 30sec without braking.					

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Control Module Internal Performance	P0606	This monitoring strategy checks for proper the CPU Compare Module functionality. The software is executed on 2 CPU cores simultaneously instruction by instruction (lock step mode). The output of both cores is compared by the CPU Compare Module. A self test runs at Init to verify that the CPU Compare Module is working properly. A fault is set if the self test failed.	Core Compare Module selftest	= failed	System voltage	> 6.9 V	Immediately	Type A, 1 Trip
		This monitoring strategy checks if there is a Central Processing Unit (CPU) exception. If a CPU exception occurs, normal program execution is no longer allowed (e.g. aborts from privileged modes). A fault is set if a data abortion, a prefetch abortion, or an undefined instruction occurs.	Data abortion occurs OR Prefetch abortion occurs OR Undefined instruction occurs	= True  = True  = True	Ignition key	= On	Immediately	Type A, 1 Trip
		This monitoring strategy checks if the execution of a sensitive process task jitters too much. A fault is set if the real process execution time is greater than its ideal start time increased by a percentage.	The execution time of the internal system process task (non ibooster systems)	> Process Ideal Time + 5% Sec	Ignition key	= On	Immediately	Type A, 1 Trip
		This monitoring checks the TPSW customer function accessibility area into the RAM. A fault is set if any customer SW variable or function tries to access outside its restricted area.	SW variable or function tries to access outside its restricted area	= True	Ignition key	= On	Immediately	Type A, 1 Trip
		This monitoring strategy checks if the A/D-converter reference voltage is out of range. A fault is set if the ADC band gap voltage is outside the allowable range.	Analog Digital Converter voltage OR Analog Digital Converter voltage	< 1.145 V  > 1.345 V	Ignition key	= On	Immediately	Type A, 1 Trip
		This monitoring strategy checks if the ECU internal electrical enable line cannot be switched on or off via the software. The electrical enable line is set directly by a microcontroller pin. When the microcontroller port changes, the enable line may take the value set by the microcontroller. If the enable line does not changen this means that the ECU enable line has shorted to the ground or to the supply voltage line (3.3V). A fault is set if the ECU internal electrical enable line value is different than the value requested from the software.	The ECU internal electrical enable line cannot be switched ON or OFF by the software	= True	System voltage AND Fail-Safe Logic Test	> 6.9 V  = On	0.45 [Sec]	Type A, 1 Trip
		This monitoring strategy checks the ECU (Electronic Control Unit) internal hydraulic enable line. A fault is set if the ECU internal electrical enable line either is shorted to ground, is shorted to the supply voltage, or cannot be switched ON or OFF by the software.	ECU internal hydraulic enable line has a short to ground OR ECU internal hydraulic enable line has a short to supply voltage (3.3V) OR The ECU internal hydraulic enable line cannot be switched ON or OFF by the software	= True  = True  = True	System voltage	> 6.9 V	0.45 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if the enable line is set properly. After the Fail-Safe Logic Test has finished the ECU (Electronic Control Unit) internal hydraulic and electrical enable lines are monitored. It is expected that the enable lines always stay at a high level. A fault is set if an interruption (an enable line at low level) of the hydraulic or electrical enable line is detected.	ECU internal hydraulic line state For time OR ECU internal electrical line state For time	= low > 0.05 Sec  = low > 0.05 Sec	System voltage	> 6.9 V	0.05 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the error pin event counter is in range. The monitor pulls the error pin to test the event counter within the system chip. To prevent an electrical shutdown (which would disturb communication) during the provoked error pin event, the electrical decouple bit is set. A fault is set if the error pin event counter does not increment, or if the decouple bit is not reset.	Error pin event counter not incremented	= True	Ignition key	= On	1 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if there is a HET exception. A fault is set if a failure is detected in the EEPROM (Electrically Erasable Programmable Read-Only Memory) cell.	Failure detected in register HET	= True	Ignition key	= On	Immediately	Type A, 1 Trip
		This monitoring strategy checks for proper of the High End Timer Transfer Unit (HETTU) addressing functionality. When a pointer error is detected, the HETTU state switches to a specific value. A fault is set if the HETTU is in the pointer error state.	High End Timer Transfer Unit Status	= "pointer error"	Ignition key	= On	Immediately	Type A, 1 Trip
		This monitoring strategy checks the High End Timer Transfer Unit (HETTU) internal bus. A fault is set if a bus error is detected.	High End Timer Transfer Unit Status	= "bus error"	Ignition key	= On	Immediately	Type A, 1 Trip
		This monitoring strategy checks the High End Timer Transfer Unit (HETTU) internal bus. A fault is set if a busy bit error is detected.	High End Timer Transfer Unit Status	= "busy bit error"	Ignition key	= On	Immediately	Type A, 1 Trip
		This monitoring strategy checks if there was a High End Timer Transfer Unit (HETTU) exception. A fault is set if an exception occurs.	Failure detected in register INT	= True	Ignition key	= On	Immediately	Type A, 1 Trip
		This monitoring strategy checks whether any tasks failed to call. A fault is set if a task did not start in the expected time.	Watchdog detects a missing task	= True	Ignition key	= On	Immediately	Type A, 1 Trip
		This monitoring strategy checks the feedback of the Fail-Safe Logic Test. The Fail-Safe Logic Test tests whether the system chip switches off the gate actuation of the Booster Master Switch when it detects a missing watchdog trigger. A fault is set if the feedback shows that the valve relay gate is not switched off.	Missing watchdog trigger AND No switched off valve relay gate	= True  = True	System voltage	> 6.9 V	0.45 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the valve relay gate actuation is properly switched off via a Serial Peripheral Interface (SPI) command during the Fail-Safe Logic Test. A fault is set if the feedback shows that the valve relay gate is not switched off.	No switch off of the valve relay gate actuation via SPI	= True	System voltage	> 6.9 V	0.45 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks the watchdog fault counter of the system integrated circuit. A fault is set if the value of this error counter exceeds a threshold.	Error counter	> 3	System voltage AND	> 6.9 V	Immediately	Type A, 1 Trip
		This monitoring strategy checks if the watchdog trigger is received as expected. An incorrect watchdog trigger signal is sent to the system chip watchdog function, which increments the watchdog error counter. A fault is set if the watchdog fault counter is not incremented.	Incorrect watchdog data sent to chip	= True	System voltage	> 6.9 V	1 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the watchdog trigger is received within a certain time by the system chip. A fault is set if not all watchdog tasks are executed within a certain period of time.	Number of watchdog tasks done	< Number of watchdog tasks	System voltage	> 6.9 V	1 [Sec]	Type A, 1 Trip
		This monitoring strategy checks the status of the watchdog. During the initialization test the watchdog status feedback from the system chip is tested against several patterns according to the ongoing sub test. A fault is set if the watchdog status is not as expected.	Watchdog status	≠ expected watchdog status	System voltage	> 6.9 V	1 [Sec]	Type A, 1 Trip
		This monitoring strategy checks the status of the watchdog. After the initialization test has finished, the status of the watchdog is continuously monitored. A fault is set if the watchdog status is not as expected.	Watchdog status	≠ expected watchdog status	System voltage	> 6.9 V	0.05 [Sec]	Type A, 1 Trip
		This monitoring strategy checks for correct NMI handling. The Error Signal Module is the central module at the microcontroller level; it handles severe microcontroller core failures and peripheral failures, and coordinates the logic tests during start-up. A fault is set if the Non-Maskable Interrupt handler detects a failure during initialization tests.	Non-maskable Interrupt is detected	= True	Ignition key	= On	Immediately	Type A, 1 Trip
		This monitoring strategy checks if a severe microcontroller core or peripheral failure has occurred. The Error Signal Module (ESM) is the central module at the microcontroller level; it handles severe microcontroller core and peripheral failures. A fault is set when a severe microcontroller core or peripheral failure is detected.	A microcontroller core failure via Error Signal Module is detected OR Peripheral failure via ESM is detected	= True  = True	Ignition key	= On	Immediately	Type A, 1 Trip
		This monitoring strategy checks whether the HET has the proper reference signal frequency. The monitor compares the defined frequency with the actual reference signal frequency, which is calculated by the HET. A fault is set if the difference between the defined frequency and the actual frequency exceeds a threshold.	Absolute(Defined frequency - calculated frequency) / defined frequency	> 0.05	Ignition key	= On	Immediately	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		<p>This monitoring strategy checks the Serial Peripheral Interface (SPI) functionalities and failures handling of the Application Specific Integrated Circuit (ASIC) used in the system. To do so, the SPI component provides special functions to perform the following tests :</p> <ul style="list-style-type: none"> <li>- reading from/writing to an undefined address EEPROM (Electrically Erasable Programmable Read-Only Memory) cell</li> <li>- writing to a non-writable EEPROM cell</li> <li>- reading a EEPROM cell with a parity failure during transmission</li> <li>- reading a EEPROM cell with a clock failure during transmission</li> </ul> <p>For each of these tests, a certain fault response is expected from the ASIC. A fault is set if at least one fault response is not as expected.</p>	<p>No or wrong error response from ASIC while reading from an undefined address register OR No or wrong error response from ASIC while writing to an undefined address register OR No or wrong error response from ASIC while writing to a non-writable register OR No or wrong error response from ASIC while reading a register with a parity error in frame 1 during transmission OR No or wrong error response from ASIC while reading a register with a parity error in frame 2 during transmission OR No or wrong error response from ASIC while reading a register with a clock failure (less clock pulses) during transmission OR No or wrong error response from ASIC while reading a register with a clock failure (more clock pulses) during transmission</p>	<p>= True = True = True = True = True = True = True</p>	System voltage	> 6.9 V	immediately	Type A, 1 Trip
		<p>The monitoring checks the received data by the Application Specific Integrated Circuit (ASIC). The ASIC of the system is connected to the microcontroller via a Serial Peripheral Interface (SPI). A fault is set if not all data has been transmitted or received.</p> <p>Parity check - The ASIC of the system is connected to the microcontroller via a serial Peripheral Interface (SPI). The monitoring checks the received data by the ASIC. A fault is set if the calculated parity does not match the parity bit.</p> <p>Bit check - The ASIC of the system is connected to the microcontroller via a serial Peripheral Interface (SPI). The monitoring checks the received data by the ASIC. A fault is set if at least one bit of the actual transmitted data is not equal to the transmit bit in register.</p> <p>Rationality check - The ASICs of the system is connected to the microcontroller via a serial Peripheral Interface (SPI). When ASIC detects a transmission failure, it sends an error frame via the SPI. The monitoring checks the frames transmitted via the SPI. A fault is set if an error frame is transmitted.</p>	<p>Length of received data OR Calculated parity of the received data OR Time out error OR Actual transmitted bits OR Clock failure OR Error frame</p>	<p>≠ length of send data ≠ received parity bit = True ≠ bits in register = True = bits in register</p>	Ignition key	= On	0.001 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if there is a Serial Peripheral Interface (SPI) communication failure. The Application Specific Integrated Circuit (ASIC) of the system is connected to the microcontroller via a SPI. The microcontroller includes hardware monitoring of the ASIC to recognize failures of the necessary input signals. The Monitor reads the results of certain of this hardware monitoring by reading out the ASIC EEPROM (Electronically Erasable Programmable Read-Only Memory) cell via Serial Peripheral Interface. A fault is set if charge-pump failure bit, or clock-input-signal failure bit, or internal-oscillator-circuit failure bit is set.	Charge-pump failure bit is set OR Clock-input-signal failure bit is set OR Internal-oscillator-circuit failure bit is set		Ignition key AND First cyclic transmission to the ASICs occurred	= On  = True	0.2 [Sec]	Type A, 1 Trip
		This monitoring strategy checks the voltage comparators of the Application Specific Integrated Circuit (ASIC). The ASIC has several voltage comparators to monitor the level of different voltage supplies. These comparators are tested at start-up for correct functionality, and the result of the test is stored as a EEPROM (Electronically Erasable Programmable Read-Only Memory) cell value. A fault is set if there is an error flag when the monitor reads the EEPROM cell value.	Error flag is set in a defined register	= True	System voltage	> 6.9 V	Three consecutive ignition cycles	Type A, 1 Trip
		This monitoring strategy checks if there is a Serial Peripheral Interface (SPI) communication failure. The L99H01 Application Specific Integrated Circuit (ASIC) of the system is connected to the microcontroller via a SPI. The microcontroller includes hardware monitoring of the ASIC to recognize failures of the necessary input signals. The Monitor reads the results of certain of this hardware monitoring by reading out the ASIC EEPROM (Electronically Erasable Programmable Read-Only Memory) cell via Serial Peripheral Interface. A fault is set if charge-pump failure bit, or watchdog failure bit, or Thermal failure bit is set.	Charge-pump failure bit is set OR Watchdog failure bit is set OR Thermal failure bit is set	= True  = True  = True	Ignition key AND First cyclic transmission to the L99H01 ASICs occurred	= On  = True	0.005 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if there is a timeout of the Serial Peripheral Interface (SPI) communication to Application Specific Integrated Circuit (ASIC). The Application Specific Integrated Circuit (ASIC) of the system is connected to the microcontroller via a Serial Peripheral Interface (SPI). The goal is to monitor the duration of the SPI transmission. A fault is set if the SPI transfer to ASIC is not finished within a defined period.	Duration of SPI transfer to ASIC	> 0.005 Sec	Ignition key AND Cyclic Tasks Started	= On  = True	0.01 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks for exceptions in Operating System. A fault is set if an exception occurs in the Operating System.	OS-exception occurs	= True	Ignition key	= On	Immediately	Type A, 1 Trip
		Detection of software component internal execution errors	Internal software state type	= Invalid	Ignition key	= On	0.01 [Sec]	Type A, 1 Trip
		This monitoring checks the TPSW-PBC function accessibility area into the RAM. A fault is set if the PBC SW variable or function tries to access outside its restricted area.	PBC SW function stays within its restricted aea	= False	Ignition key	= On	0.02 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the Static Random Access Memory (SRAM) and peripheral Random Access Memory (RAM) are initialized or not. The SRAM and peripheral RAM are cleared at power-up. Then This monitoring reads every SRAM and RAM addresses. A fault is set if at least one addresses is not initialized to zero.	At least one RAM or SRAM bit	≠ 0	Ignition key	= On	Immediately	Type A, 1 Trip
		This monitoring strategy checks for proper pull-up resistor functionality. It monitors whether the motor relay pull-up (MRPU) switch inside the Application Specific Integrated Circuit (ASIC) is working as expected. A fault is set if the MRPU pin status does not match the selected switch state.	Motor relay pull-up pin status not correct	= True	System voltage AND Hydraulic pump motor	> 6.9 V  = Off	0.5 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if a wrong hexfile was flashed in the AECU. The purpose of RTP pins is to do measurement of RAM variables. A fault is set if the RTP Enable pin is stuck to a high.	RTP Enable pin stuck to high	= True	Ignition key	= On	Immediately	Type A, 1 Trip
		The System Mode Manager (SMM) asks in parallel with multiple system modes for the individual modules. To do this, it receives requests from different parts of software which are initialized at the beginning and after a while a valid value is given which is not "init" value. A fault is set if after a while one requester is still in init value.	One requester still in init value for time	> 3.6 Sec	Ignition key	= On	3.6 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the microcontroller stack has over or underflowed. During initialization, stack memory cells are set at the beginning and at the end of the stack area: these Stack memory cells are checked periodically. A fault is set if one of these Stack memory cells has been overwritten.	End-stack word overwritten OR Beginning-stack word overwritten	= True  = True	Ignition key	= On	0.04 [Sec]	Type A, 1 Trip
		During system start-up, the time required to configure the application software (ASW) is monitored. A fault is set if the configuration lasts longer than a defined amount of time.	ASW configuration time	> 5 Sec	Ignition key	= On	5 [Sec]	Type A, 1 Trip
		This monitoring strategy checks for an unsupported Bootblock and FSW clock configuration in ECU. Within an ECU, the Bootblock allows actualizing the application which is called FSW. A failure is set if the Bootblock and FSW clock settings are different.	Bootblock and FSW clock settings are different	= True	Ignition key	= On	Immediately	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if an internal fault has occurred in the operating system. A fault is set if software interrupts have occurred but: - the interrupt is invalid. - An interrupt lock release is called without previous lock. - not all interrupts are released.	Software interrupt occurred AND { Invalid interrupt occurred OR Interrupt lock release is called without previous lock OR Not all interrupts are released OR Interrupt lock time }	= True  = True  = True  = True  > 0.001 Sec	Ignition key	= On	Immediately	Type A, 1 Trip
		This monitoring strategy checks if interrupts are properly running. The error signal module is the central module in the microcontroller level. It handles severe microcontroller core failures or peripheral failures, and coordinates the logic tests during start-up. A fault is set if no or not expected non-maskable interrupt occurs during Init tests.	Failure detected during safety logic startup tests	= True	System voltage	> 6.9 V	Immediately	Type A, 1 Trip
		This monitoring strategy checks if the software is properly configured for the hardware. Software version and device identifiers of the Application Specific Integrated Circuit (ASIC) and of the microcontroller are compared with the software version and identifiers of the configuration software. A fault is set if a least one ID or software version does not match.	Received ID of microcontroller is not identical with the ID stored in the software	= True	Ignition key	= On	0.03 [Sec]	Type A, 1 Trip
		This monitoring checks the valve channels during the freewheeling test. This test consists of splitting up several small pulses to slowly accelerate the pump. The acceleration is slow in order to avoid noise generation. A fault is set if an unused valve channel is detected during the freewheeling test or if the Valve-Driver-ASIC (Application Specific Integrated Circuit) activation channel is defective.	Unused valve channel detected OR Valve-Driver-ASIC activation channel defect	= True  = True	Ignition key AND FreeWheeling Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This is a monitoring of the Valve-Driver-ASIC (Application Specific Integrated Circuit) freewheeling path, which slowly accelerates the pump to avoid noise generation. A fault is set if the Valve-Driver-ASIC freewheeling path was activated for a longer time period than the maximum freewheeling time.	Valve-Driver-ASIC freewheeling path was activated for longer time than freewheeling time	> 0.03 Sec	Ignition key AND Valve test	= On  = Off	0.03 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the valve is activated properly. During an activation of all valves, the feedback gate of the Valve-Driver-ASIC (Application Specific Integrated Circuit) shows valve activation although the Hydraulic Enable of the Valve-Driver-ASIC is low with. A fault is set if the feedback duty on (Gate ON) for maximum valve actuation during testing exceeds a calibrated threshold.	Feedback duty on (Gate ON) for maximum actuation of valve under test	= 100 %	Ignition key	= On	0.005 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if there is a pulse width modulation (PWM) failure in all 12 valves. A fault is set if the PWM check sequence is not completed during the duration of the Valve Actuation Register Test (VART).	Pulse width modulation check sequence is not completed during the running period of Valve Actuation Register Test	= True	Ignition key AND PWM Monitor OR Valve Actuation Register Test OR Valve Drift Check	= On  = On  = On  = On	0.005 [Sec]	Type A, 1 Trip
		This monitoring strategy checks the Silent Valve Driver Test (SVDT) results. SVDT is a periodic check that is initiated by the software. The test runs automatically at the Application Specific Integrated Circuit (ASIC), and in case of a positive result, feedback is sent to the software via the SPI (Serial Peripheral Interface) bus. A fault is set if successful feedback is not received from the finished Silent Valve Driver Test (VDT) via the SPI-bus.	Feedback of a successful finished Silent Valve Driver Test via SPI-bus not received	= True	Ignition key	= On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the configuration bits of the Valve-Driver-ASIC register are written correctly. A fault is set if the read data of the Application Specific Integrated Circuit (ASIC) configuration bits do not match with the corresponding written data in ASIC.	Configuration of Valve-Driver-ASIC register not correct	= True	Ignition key AND Hydraulic Enable signal high	= On  = True	0.03 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the result of the built-in self-test (BIST) is correct. The built-in self-test (BIST) is an internal hardware valve driver test triggered by the software. It checks the functionality of both arithmetic logic units (ALU) of the current controller. Both ALUs are triggered by different patterns. A fault is set if the BIST results are not as expected.	Valve driver BIST result from ALU not as expected	= True	Ignition key AND BuidInSelfTest (BIST)	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the serial high end timer transmission between the microcontroller and the valve-driver has failed. A fault is set if a wrong protocol, timing deviation, or lack of data transmission is detected.	SHET protocol wrong OR Timing deviation OR No data transmission	= True  = True  = True	Ignition key	= On	0.03 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the VART (Valve Activation Register Test) detects an error. The internal valve driver activation registers are tested using the VART in order to detect any crosstalk or stuck situations. All the valves are opened and closed sequentially according to a matching test pattern. A valve opening draws a low valve relay current. A fault is set if an open load or under current state is not detected for each valve actuation.	Valve relay voltage / Internal supply voltage OR Valve Current	< 0.33  > 0.1 A	Ignition key	= On	140 [Sec]	Type A, 1 Trip
		This monitoring checks the plausibility of the valve activation state bit. The valve opening draws a low valve relay current. The bit should be set when the valve is off. A fault is set if the bit is set even though the ratio of valve relay output voltage (UVR) to internal supply voltage (UBVR) indicates that the valve is on.	Valve relay voltage / Internal supply voltage AND Valve actuation	> 0.5  = True	Ignition key AND Valve relay supply voltage	= On  > 6.9 V	120 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring compares the valve relay output voltage read by the Application Specific Integrated Circuit (ASIC) with the valve relay output voltage read by the Analog to Digital Converter (ADC) in order to check that the valve driver ensures circuit continuity. A fault is set if the difference between the two voltages is above a calibrated threshold	Absolute(measured ASIC voltage - read ADC voltage)	> 0.4 V	Ignition key AND SilentValveDriverTest (SVDT)	= On  = On	0.03 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if a low ohmic side circuit from the valve voltage (UVR) to the supply voltage (UBVR) occurs during the resistor measurement. During this measurement, the valve relay output voltage should ideally be zero. A fault is set if UVR is higher than a calibrated threshold.	Valve relay output voltage	> 1.26 V	Ignition key AND Resistor Measurement Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if there are internal and input signal failures of the Application Specific Integrated Circuit (ASIC). The ASIC is connected to the microcontroller by Serial Peripheral Interface (SPI). The monitor reads the results of this hardware monitoring EEPROM (Electrically Erasable Programmable Read-Only Memory) cell using Serial Peripheral Interface. The bits of the EEPROM cell are set by the hardware logic "Voltage-Pre_regulator-Mode". A fault is set if the voltage-pre-regulator-mode failure bit is set.	Voltage-pre-regulator-mode failure bit is set	= True	Ignition key	= On	0.2 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if wheel speed signals are correct. The Multiplexer IC inside the EBCU (Electronic Brake Control Unit) handles the EBCU internal transmission of the wheel speed sensor signals of all four wheels. To ensure safe EBCU internal transmission these signals are multiplexed and the multiplexed signal is sent on a separate signal path within EBCU. The Multiplexer IC signal check compares the EBCU internal signals with the multiplexed signal. A fault is set if the wheel speed signals and the multiplexed signal are not identical.	Wheel speed signal and multiplexed wheel speed sensor not identical	= True	System voltage AND Wheel speed sensor test completed	> 6.9 V  = True	dependent on vehicle speed	Type A, 1 Trip
		This monitoring strategy checks if the current wheel speed sensor configuration is correct via Serial Peripheral Interface (SPI). The system supports different wheel speed sensor configurations. A fault is set if, for a calibrated duration, there is a mismatch between the current wheel speed sensor mode software configuration (stored in a register) and the hardware configuration.	Mismatch between current WSS Mode software configuration stored in a register and the hardware configuration For time	= True > 0.1 Sec	Ignition key AND First cyclic transmission to ASIC	= On  = True	0.1 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if there is an hardware defect. The Wheel Speed Sensor (WSS) System Integrated Circuit performs a check of the WSS wirings at System start-up automatically by switching sensor supply lines separately and storing the states of input comparators in a buffer. The buffer content is then evaluated in software. A fault is set if the buffer content shows a physically impossible condition.	Detected wheel speed sensor line condition is physically impossible	= True	System voltage AND Initial wheel speed sensor hardware tests AND Started with Hardware Reset OR Started with Software Reset	> 6.9 V  = On  = True  = True	0.015 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 30sec without braking. Accelerate vehicle to at least 18.6 mph and hold the speed for at least 20s.					
Control Module Long Term Memory Performance	P062F	This monitoring strategy checks if there is enough available space in the EEPROM (Electrically Erasable Programmable Read-Only Memory) to allocate a data field. A fault is set if the size of the data field is bigger than the amount of available space in EEPROM.	Data field size to allocate	> Available Space	System voltage AND Ignition key	> 6.9 V  = On	Immediately	Type A, 1 Trip
		This monitoring strategy checks if it is possible to write data in persistent storage. Every write access to non-volatile memory in the EEPROM (Electrically Erasable Programmable Read-Only Memory) is protected by timeout monitoring and data verification after writing. The Persistent Data Manager checks persistent data access in EEPROM. A fault is set if a write operation occurs or if data verification after writing fails.	Writing operation AND Read data different from written data	> 0.025 Sec  = True	Ignition key	= On	immediately	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Control Module Long Term Memory Reset	P0603	This monitoring checks the write result at the end of the EEPROM write procedure. A fault is set if a cell is invalid which results to a read back error after writing	Read back error	= True	Ignition key	= On		Type A, 1 Trip
		This monitoring strategy checks if the customer identifier is correct. During initialization, the persistent data manager compare the EEPROM (Electrically Erasable Programmable Read-Only Memory) cell value with the expected customer ID. A fault is set if the expected customer ID does not match the stored customer ID.	Stored customer ID	≠ expected customer ID	System voltage AND Ignition key	> 6.9 V  = On	Immediately	Type A, 1 Trip
		This monitoring strategy checks if the system has not found the enhanced platform software end marker, which is used to help the system find the end of the data. At ignition state, the Persistent Data Manager checks the content of the EEPROM (Electrically Erasable Programmable Read-Only Memory). A fault is set if the enhanced platform software end marker has not been found.	No enhanced platform software end marker in EEPROM	= True	System voltage AND Ignition key	> 6.9 V  = On	Immediately	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if the stored data field size is correct. At ignition state, the Persistent Data Manager checks the content of the EEPROM (Electrically Erasable Programmable Read-Only Memory). A fault is set if a data field size in EEPROM does not match the corresponding data item configuration in the software.	Data field size in the EEPROM	≠ data size configuration in software	Ignition key	= On	Immediately	Type A, 1 Trip
		This monitoring strategy checks the reading accessibility of the EEPROM (Electrically Erasable Programmable Read-Only Memory). During initialization, the Persistent Data Manager checks the content of the EEPROM. A fault is set if an access error occurs while reading EEPROM.	Read error occurs OR Not expected Non-Markable Interrupt detected	= True  = True	System voltage	> 6.9 V	Immediately	Type A, 1 Trip
		This monitoring strategy checks if the EEPROM (Electrically Erasable Programmable Read-Only Memory) memory is readable. Besides the management of the electronic stability system the Electronic Brake Control Unit (EBCU) performs various functional checks. Initially and periodically, the memory content is checked by calculating a 64-bit CRC (Cyclic Redundancy Check) value and comparing it with the checksum generated during the software build process. This algorithm checks the complete memory content. A fault is set if it is not possible to read back data from EEPROM or if the data read back from EEPROM is not valid.	EEPROM data cannot be read OR EEPROM data not valid	= True  = True	Ignition key	= On	Immediately	Type A, 1 Trip
		This monitoring strategy checks if EEPROM (Electrically Erasable Programmable Read-Only Memory) access is possible. The reference resistor is used to calculate the reference current. A fault is set if it is not possible to load the reference resistor value stored in EEPROM. In this case, the EEPROM value is defective or unreadable.	Cannot load the reference resistor value stored in the EEPROM	= True	Ignition key AND Resistor Measurement Test	= On  = On	Immediately	Type A, 1 Trip
		This monitoring strategy checks if the reference resistor voltage stored in EEPROM (Electrically Erasable Programmable Read-Only Memory) matches the measured resistor voltage. The reference resistor voltage is measured in the factory. A fault is set if the absolute difference between the reference resistor voltage stored in EEPROM and the measured resistor voltage exceeds a calibrated threshold.	Absolute(Reference resistor voltage stored in the EEPROM - Measured resistor voltage)	> 10 %	Ignition key AND Resistor Measurement Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitor checks the configuration of the wheel speed sensors after ignition on. The failure is do to a PDM access problem or a wrong value in the wheel speed sensor type. A failure is set if after ignition ON, the configuration of the wheel speed sensor type is not possible.	Wheel speed sensor type configuration possible	= False	Ignition key	= On	immediately	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Control Module Not Programmed	P0602	This monitoring check if the Electronic Brake Control Module (EBCM) has not been programmed with calibration data set. A fault is set if the byte 5 of the internal customer data for each of the 5 calibration modules is equal to ACII D	Byte 5 of the internal customer data for each of the 5 calibration modules is equal to ACII D	= True	Ignition key	= On	Immediately	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 30sec without braking.					
Control Module Random Access Memory (RAM)	P0604	This monitoring strategy checks the values of a specific RAM area. Furthermore, the address decoder is tested using test patterns to ensure bus integrity. The test writes different patterns at the addresses of this RAM area. Addresses are then read out and a signature for all the readout values is calculated. The original content in RAM is afterwards rewritten. The order of the patterns is chosen so that the signature the multibit and coupling failures can be set during the signature evaluation. A fault is set if a multibit or coupling failure is detected.	Multi-bits failure detected OR Coupling failure detected OR Address decoder test detects an error	= True  = True  = True	System voltage	> 6.9 V	Immediately	Type A, 1 Trip
		This monitoring strategy checks correct functionality of Random Access Memory (RAM) through a programmable Built In Self Test running in start-up phase.	Memory test fails	= True	Ignition key	= On	Immediately	Type A, 1 Trip
		This monitoring strategy checks if there is a single bit error at RAM. Because of Error Correction Code, RAM single-bit errors are always corrected. A fault is set if the number of bit errors exceeds a threshold.	Number of detected single-bit errors	> 2	Ignition key	= On	Immediately	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Control Module Read Only Memory (ROM)	P0601	This monitoring strategy checks if the CRC (Cyclic Redundancy Check) of Flash EEPROM (Electrically Erasable Programmable Read-Only Memory) is correct. Initially and periodically the complete Flash EEPROM contents are checked by calculating a CRC value and comparing it with the checksum generated during the software build process. A fault is set if a double bit error of Flash EEPROM is detected, or if more than a defined number of single bit errors are detected (otherwise, single bit errors are corrected).	Double bit error detected OR Number of detected single-bit errors	= True  > 1	System voltage	> 6.9 V	Immediately, during start-up or respectively after 60 sec for cyclic flash checksum test.	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Ignition Switch - Accessory Position - Circuit Low	P2537	Detects an accessory position circuit open	Accessory	= False	Propulsion System Active Propulsion System Active Time	= True > 0.5 Sec	0.5 [Sec]	Type B, 2 Trips

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Ignition Switch - Circuit High	P2535	Detects if the Run/Crank input circuit is high	Short to Battery	> 5 V	CAN Communication And ECM Run/Crank Active Data	= Enabled  = False	2.5 [Sec]	Type A, 1 Trip
Ignition Switch - Circuit Low	P2534	Detects if the Run/Crank input circuit is low	Short to Ground Or Open Condition	< 2 V  = True	CAN Communication And ECM Run/Crank Active Data	= Enabled  = Active	2.5 [Sec]	Type A, 1 Trip
Internal Control Module A/D Processing Performance	P060B	This monitoring strategy checks the conversion time of the ADC (Analog Digital Converter). The ADC periodically reads an analog signal and converts it into digital values. Before starting a new conversion, the monitor checks that the previous conversion is finished. A fault is set if the previous conversion is not finished for a number of checks.	Number of times that the previous analog to digital conversion is not finished	> 9	Ignition key	= On	0.003 [Sec]	Type A, 1 Trip
		This monitoring strategy checks proper functionality of ADC self-test. To do this, ADC channels are switched to two predefined internal microcontroller resistors to measure defined (voltage) levels (high and low). The absolute differences between the two measurements are calculated in unit digits. A fault will be set if the difference is greater than a threshold.	Absolute(difference between the two ADC measurements)	> 540 digitSec	Ignition key	= On	0.2 [Sec]	Type A, 1 Trip
		This monitoring strategy checks for correct internal Analog Digital Converter (ADC) functionality by comparing the analog motor voltage read in by the ADC with the digital motor voltage calculated by the Application Specific Integrated Circuit (ASIC) while the hydraulic pump is active. A fault is set if the deviation between the hydraulic pump motor voltage read by the ADC (analog) and the hydraulic pump motor voltage calculated by the ASIC (digital) exceeds a calibrated threshold.	Hydraulic pump motor voltage read by ADC (analog)/hydraulic pump motor voltage calculated by ASIC (digital)	> 0.25	Ignition key AND Hydraulic pump motor	= On  = On	0.04 [Sec]	Type A, 1 Trip
		DTC Pass	Drive off, accelerate up to 37.2 mph and maintain this speed for at least 5s					
Left Front Inlet Control	C0010	This monitoring strategy checks if the Valve-Driver-ASIC (Application Specific Integrated Circuit) FreeWheeling component is defective. A fault is set if the valve driver freewheeling cannot be switched on or off or if the trigger state is incorrect.	Freewheeling of valve driver cannot be switched OR Trigger state not correct	= True  = True	Ignition key AND Resistor Measurement Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the valve actuation corresponds to the expected value. The basic valve monitoring is triggered by the coordinator via the control message. A fault is set if the valve actuation is different from the expected value for a calibrated period of time.	Valve actuation	≠ expected value	Ignition key AND Resistor Measurement Test	= On  = Off	0.03 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if the current through a valve is too high or too low. A fault is set if the valve current is above a calibrated threshold_1 or below a calibrated threshold_2 for a calibrated number of failed tests.	(Current through the valve OR Current through the valve) AND Both for a number of failed tests	> 0.12 A  < 0.085 A  > 5	Ignition key AND Leakage Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks the voltage at the output Qx or at the gate to detect if the Valve-Driver-ASIC (Application Specific Integrated Circuit) output driver is not functioning correctly. All PWM (Pulse Width Modulation) signal positive edges are counted, and the low time duration is measured. The resulting value is read out via SPI (Serial Peripheral Interface). The high and low limits of the real PWM signal, which are set by the output driver, are calculated using the measured number of edges and the low time. The calculated high and low limits depend on the activation used. A fault is set if the current activation value is outside the calculated limits.	Measured actuation duty OR Measured actuation duty AND Both for a number of times	< Set Actuation Duty - 20%  > Set Actuation Duty + 20%  > 5	Ignition key AND Resistor Measurement Test AND Leakage Test AND Valve Activation Register Test AND Silent Valve Driver Test	= On  = Off  = Off  = Off	0.05 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the transistor gates are set properly. Qx is the command sent to the transistor gate which commands the valve motor. The Qx monitor compares the expected value of Qx (the calculated Qx-ON/OFF value which is dependent on the current set valve activation) with the actual value of Qx (Qx-ON/OFF from the valve-related SPI (Serial Peripheral Interface) register) in order to check for correct output driver functionality (gate on/off). A fault is set if the actual Qx value does not match the expected Qx value.	(Measured Gate On Actuation Duty OR Measured Gate Off Actuation Duty) AND For a number of failed tests	< 95 %  > 5 %  > 5	Ignition key AND Resistor Measurement Test AND Leakage Test AND Valve Activation Register Test AND Silent Valve Driver Test	= On  = Off  = Off  = Off	0.03 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the valve-related resistor value is out of range during the resistor measurement. This resistor value is calculated by taking the mean of the voltage through the resistor. A fault is set if the valve resistor value is too high or too low.	Comparison of calculated resistance and measured resistance OR Comparison of calculated resistance and measured resistance AND For a number of times	> 0.2 Of calculated resistance  < -0.2 Of calculated resistance  > 2	Ignition key AND Resistor Measurement Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if there is a short circuit between valves or a defective coil (due to Valve-Driver-ASIC (Application Specific Integrated Circuit) internal failure such as OpenLoad, UnderCurrent, OverCurrent, OverTemp, PGndLost or DxLost) during the Valve-Driver-ASIC Silent Valve Driver Test (SVDT). A fault is set if the ASIC current or temperature is below a calibrated threshold_1 or above a calibrated threshold_2, or if the High Side Switch Line Loss is below a calibrated threshold, for a calibrated number of failed tests.	(Current at ASIC OR Current at ASIC OR Temperature at ASIC OR Temperature at ASIC OR High Side Switch Line Loss) AND For a number of times	< 0.05 A  > 0.14 A  < 25 °C  > 140 °C  < 0.005 A  > 2	Ignition key AND Silent Valve Driver Test	= On  = On	0.015 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if the internal valve-driver-ASIC (Application Specific Integrated Circuit) register matches the current actuation during the Valve Actuation Register Test (VART). A fault is set if the measured gate actuation duty during the test actuation exceeds a calibrated threshold.	Measured gate actuation during test actuation AND For a number of times	< 0.005 A  > 2	Ignition key AND Valve Activation Register Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
					See Disabling DTCs	Not Fault Active		
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Left Front Outlet Control	C0011	This monitoring strategy checks if the valve actuation corresponds to the expected value. The basic valve monitoring is triggered by the coordinator via the control message. A fault is set if the valve actuation is different from the expected value for a calibrated period of time.	Valve actuation	≠ expected value	Ignition key AND Resistor Measurement Test	= On  = Off	0.03 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the current through a valve is too high or too low. A fault is set if the valve current is above a calibrated threshold_1 or below a calibrated threshold_2 for a calibrated number of failed tests.	(Current through the valve OR Current through the valve) AND Both for a number of failed tests	> 0.12 A  < 0.085 A  > 5	Ignition key AND Leakage Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks the voltage at the output Qx or at the gate to detect if the Valve-Driver-ASIC (Application Specific Integrated Circuit) output driver is not functioning correctly. All PWM (Pulse Width Modulation) signal positive edges are counted, and the low time duration is measured. The resulting value is read out via SPI (Serial Peripheral Interface). The high and low limits of the real PWM signal, which are set by the output driver, are calculated using the measured number of edges and the low time. The calculated high and low limits depend on the activation used. A fault is set if the current activation value is outside the calculated limits.	Measured actuation duty OR Measured actuation duty AND Both for a number of times	< Set Actuation Duty - 20%  > Set Actuation Duty + 20%  > 5	Ignition key AND Resistor Measurement Test AND Leakage Test AND Valve Activation Register Test AND Silent Valve Driver Test	= On  = Off  = Off  = Off  = Off	0.05 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the transistor gates are set properly. Qx is the command sent to the transistor gate which commands the valve motor. The Qx monitor compares the expected value of Qx (the calculated Qx-ON/OFF value which is dependent on the current set valve activation) with the actual value of Qx (Qx-ON/OFF from the valve-related SPI (Serial Peripheral Interface) register) in order to check for correct output driver functionality (gate on/off). A fault is set if the actual Qx value does not match the expected Qx value.	(Measured Gate On Actuation Duty OR Measured Gate Off Actuation Duty) AND For a number of failed tests	< 95 %  > 5 %  > 5	Ignition key AND Resistor Measurement Test AND Leakage Test AND Valve Activation Register Test AND Silent Valve Driver Test	= On  = Off  = Off  = Off  = Off	0.03 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if the valve-related resistor value is out of range during the resistor measurement. This resistor value is calculated by taking the mean of the voltage through the resistor. A fault is set if the valve resistor value is too high or too low.	Comparison of calculated resistance and measured resistance OR Comparison of calculated resistance and measured resistance AND For a number of times	> 0.2 Of calculated resistance  < -0.2 Of calculated resistance  > 2	Ignition key AND Resistor Measurement Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if there is a short circuit between valves or a defective coil (due to Valve-Driver-ASIC (Application Specific Integrated Circuit) internal failure such as OpenLoad, UnderCurrent, OverCurrent, OverTemp, PGndLost or DxLost) during the Valve-Driver-ASIC Silent Valve Driver Test (SVDT). A fault is set if the ASIC current or temperature is below a calibrated threshold_1 or above a calibrated threshold_2, or if the High Side Switch Line Loss is below a calibrated threshold, for a calibrated number of failed tests.	(Current at ASIC OR Current at ASIC OR Temperature at ASIC OR Temperature at ASIC OR High Side Switch Line Loss) AND For a number of times	< 0.05 A  > 0.14 A  < 25 °C  > 140 °C  < 0.005 A  > 2	Ignition key AND Silent Valve Driver Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the internal valve-driver-ASIC (Application Specific Integrated Circuit) register matches the current actuation during the Valve Actuation Register Test (VART). A fault is set if the measured gate actuation duty during the test actuation exceeds a calibrated threshold.	Measured gate actuation during test actuation AND For a number of times	< 0.005 A  > 2	Ignition key AND Valve Activation Register Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Left Front Wheel Speed Sensor Circuit High	C0503	This monitoring strategy checks if there is a shortcut of WSS signal line to the battery.	Voltage of WSS signal line	> 12 V	System voltage AND Wheel speed sensor test completed	> 6.9 V  = True	0.12 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Left Front Wheel Speed Sensor Circuit Low	C0502	This monitoring strategy checks for a line failure on the front left wheel speed sensor. In the line monitor, if a failure is detected, ASIC registers are evaluated and the corresponding failures are set. A fault is set if no precise line failure can be determine.	A failure is detected AND Wheel Speed Sensor Current Supply Line Monitoring AND Wheel Speed Sensor Voltage Monitoring AND Wheel Speed Sensor Current Signal Line Monitoring	= True  = False  = False  = False	System voltage AND Wheel speed sensor test completed	> 6.9 V  = True	0.12 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if there is an electrical failure in the wheel speed sensors. The sensor current and the sensor voltage are monitored by a comparator circuit in an ASIC (Application Specific Integrated Circuit). A fault is set if the current at the supply line is below a calibrated threshold.	Sensor current at supply line	< 0.16 A	System voltage AND Wheel speed sensor test completed	> 6.9 V  = True	0.12 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Left Front Wheel Speed Sensor Circuit/Open	C0500	This monitoring strategy checks if there is an electrical failure in the wheel speed sensors. The sensor current and the sensor voltage are monitored by a comparator circuit in an ASIC (Application Specific Integrated Circuit). A fault is set if the sensor current at the signal line is below a calibrated threshold.	Sensor current at the signal line	< 0.0038 A	System voltage AND Wheel speed sensor test completed	> 6.9 V  = True	0.12 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Left Front Wheel Speed Sensor Incorrect Component Installed	C0555	This monitoring strategy checks if the Wheel Speed Sensor (WSS) is mounted at the correct wheel. Since the WSS signals differ for different WSS sensor types, the EBCU (Electronic Brake Control Unit) is able to recognize incorrect WSS placement by evaluating the signal. The intelligent WSS signal provides additional information (air gap) encoded in bits 0-8. Each detection event is followed by a stop pulse. A fault is set if the stop pulse is missing for a calibrated period of time.	No stop pulse according to wheel speed sensor protocol detected	= True	Wheel speed sensor test completed AND Ignition key	= True  = On	3 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Left Front Wheel Speed Sensor Intermittent/Erratic	C0504	This monitoring strategy checks if the High End Timer Transfer Unit (HETTU) buffer has overflowed. The HETTU buffer stores the time stamp of the wheel speed sensor outputs. This buffer has a status which tells whether the buffer can be used or not. A common PIC (Programmable Interrupt Controller) checks if the HETTU buffer is in the overflow state. In this case the buffer cannot be used because more edges occur on the wheel speed sensor channels than the buffer can store. A fault is set if the HETTU buffer is in the overflow state.	HET TU buffer state	= Overflow	Ignition key	= On	0.03 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Left Front Wheel Speed Sensor Range/Performance	C0501	This monitoring strategy checks if there is a defective wheel speed sensor. A fault is set if the speed of one wheel speed sensor is zero and the other wheel speed sensor speeds are above a calibrated threshold. Additionally the vehicle speed has to be above a calibrated threshold.	Speed of 1 wheel AND Speed of 3 wheels	= 0 mph  > 0 mph	Ignition key AND Anti-Lock Braking intervention AND Vehicle speed AND System voltage AND Traction Control System Intervention	= On  = False  > 11.8 mph  > 6.9 V  = False	Immediately	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if the wheel speed sensors is defective. It can be done after standstill, start-up monitoring at low speed, as well as while driving, start-up monitoring at high speed. The main principle of the start-up monitoring is to compare the speed signal from all four wheels to each other. A fault is set if the speed of the monitored wheel is below a calibrated threshold while the speed of the other wheels is above a calibrated threshold.	FR, RL, RR Wheel speed sensor AND FL Wheel speed sensor	> 7.45 mph  = 0 mph	Check at low speed: Initial vehicle speed AND Anti-Lock Braking System intervention AND Traction control system intervention OR Check at high speed: Anti-Lock Braking System intervention AND Traction control system intervention	< 1.8 mph  = False  = False  = False  = False	Immediately	Type A, 1 Trip
		This monitoring strategy checks if the wheel speed signal is missing due to faulty wheel speed information. A fault is set if the wheel speed signal is missing for a calibrated duration ( $\Delta t$ ) and the wheel deceleration is below a calibrated threshold.	No wheel speed signal for a time AND Wheel deceleration	> 0.08 Sec  < 300 m/Sec <sup>2</sup>	Ignition key AND Anti-Lock Braking intervention AND Vehicle speed AND System voltage AND Traction Control System Intervention AND Hydroplaning detected	= On  = False  > 26.84 mph  > 6.9 V  = False  = False	0.08 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the wheel speed sensor PWM (Pulse Width Modulation) is functioning correctly. The wheel speed sensor returns a PWM signal with a frequency which is dependent on the vehicle velocity. The vehicle velocity is determined by counting every rising-edge of the signal periodically for a fixed time. A threshold is calculated with the two last rising-edges values to filter a missing edge value due to high deceleration. A fault is set if the number of rising-edges for the next cycle is lower than this calculated threshold. This monitor uses rough road detection to distinguish gaps in the edge cycle signal caused by real faults from those caused by driving on rough roads.	Number of rising-edge per cycle	< Threshold calculated by mean of the two latest edge- cycle	Vehicle speed AND Vehicle speed AND Anti-lock Brake System Interventions AND System voltage AND Ignition key	> 6.21 mph  AND < 37.36 mph  = False  > 6.9 V  = On	Immediately	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks for a discontinuous wheel speed sensor signal, caused for example by impulse wheel vibration. The vibrations induce additional frequencies to the wheel speed sensor signal. The noise monitoring consists of three checks which lead to a noise fault. The first check evaluates the acceleration of each wheel speed sensor. The second check evaluates the amplitude of the noise events. A weighing factor is calculated according to the noise amplitude value. The third check evaluates the number of edges. A fault is set if two implausible high wheel speed accelerations occur within a calibrated duration, if the wheel speed acceleration is above a calibrated threshold, if the accumulation of the weighted noise amplitude is above a calibrated threshold during the actual driving cycle, or if the number of detected edges increases above a calibrated threshold within a calibrated period of time.	W/hel acceleration AND For a calibrated number of counts For time OR W/hel acceleration AND Accumulation of the weighted noise amplitude in current driving cycle OR Number of detected edges increases from To For time	> 9.81 m/Sec^2  = 2 < 1.2 Sec  > 500 m/Sec^2  > 4  < 3 > 5 < 0.005 Sec	System voltage AND Ignition key	> 6.9 V  = On	20 [Sec]	Type A, 1 Trip
		This monitoring strategy checks each wheel speed sensor signal for implausibly high wheel speed values. A fault is set if the wheel speed signal value is above a calibrated threshold for a calibrated duration.	Measured wheel speed For time	> 183.9 mph > 5.04 Sec	System voltage AND Ignition key	> 6.9 V  = On	5.04 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the difference between the wheel speed sensor signals is within a range. A fault is set if the difference in wheel speed between a single wheel speed sensor and all other wheel speed sensors is above a calibrated threshold. If the vehicle speed is below a calibrated value, the malfunction threshold is a fixed value. If the vehicle speed is above this calibrated value, the malfunction threshold is proportional to the actual vehicle speed.	Difference between maximum and minimum wheel speed for vehicle speed OR Difference between maximum and minimum wheel speed for vehicle speed	> 3.7 mph < 12.4 mph  > 6 % > 12.4 mph	Ignition key	= On	72 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the Wheel Speed Sensor (WSS) is mounted properly. This monitor continuously evaluates continuously the distance between the impulse wheel and the WSS. The WSS evaluates the magnetic flux density to detect an air gap failure. A fault is set if the air gap is too large which is indicated by a magnetic flux density below a calibrated threshold for a calibrated number of wheel rotations.	Magnetic flux density AND for a number of wheel rotations	< 0.0022 T  > 5	Ignition key AND Wheel speed sensor test completed	= On  = True	0.1 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		The monitoring checks if the stop pulse from each wheel speed sensor (WSS) is detected. The intelligent WSS signal provides additional information (air gap) encoded in bits 0-8. Each detection event is followed by a stop pulse. A fault is set if the Application Specific Integrated Circuit (ASIC) does not detect a stop pulse after some time and if there is no level change on the wheel speed sensor signal for some time.	No stop pulse detected For time OR No level change on signal For time	= True > 0.15 Sec  = True > 3.5 Sec	Vehicle speed AND For time AND Wheel speed sensor test completed	< 1.12 mph  > 10 Sec  = True	3.5 [Sec]	Type A, 1 Trip
		This monitoring strategy checks the supply voltage of the corresponding wheel speed sensor. Each wheel speed sensor is switched on separately. A fault is set if the sensor supply voltage is below a calibrated threshold during the initial phase.	Sensor supply voltage of the respective wheel speed sensor	< 11 V	Ignition key AND System voltage AND	= On  > 6.9 V	0.035 [Sec]	Type A, 1 Trip
		DTC Pass	Accelerate vehicle to at least 37.3 mph and hold the speed for at least 7s					
Left Rear Brake Pressure Sensor Circuit High Voltage	C0576	This monitoring strategy checks if there is a short circuit to the supply voltage in the pressure sensor line. To do this, it compares the signal line voltage with the supply voltage. The signal line maximum voltage should be lower than the supply voltage. A fault is set if there is no difference in voltage between the signal line and the supply line.	Signal line voltage	> 3.3 V	Ignition key	= On	0.1 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Left Rear Brake Pressure Sensor Circuit Low Voltage	C0575	This monitoring strategy checks if there is a short circuit to ground in the pressure sensor line. To do this, it compares the signal line voltage with the ground voltage. The signal line minimum voltage should be higher than the ground voltage. A fault is set if there is no difference in voltage between the signal line and the ground.	Signal line voltage	< 0.3 V	Ignition key	= On	0.1 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Left Rear Brake Pressure Sensor Circuit Performance	C0578	This monitoring strategy checks if the offset compensation of the pressure sensor is out of range. The zero-point of the pressure sensor signal is adjusted to compensate for any signal drifts. The offset compensation is only performed when the brake pedal is not applied (corresponding to the pressure sensor zero point). A fault is set if the offset is outside a calibrated range.	Measured pressure OR Measured pressure	> 1500 KPa  < -1500 KPa	System voltage AND Brake pedal is pushed AND Acceleration pedal is pushed AND Vehicle speed	> 6.9 V  = False  = True  > 4.47 mph	Immediately	Type A, 1 Trip
		DTC Pass	Drive off, accelerate up to 37.2 mph and maintain this speed for at least 5s					

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Left Rear Inlet Control	C0018	This monitoring strategy checks if the Valve-Driver-ASIC (Application Specific Integrated Circuit) FreeWheeling component is defective. A fault is set if the valve driver freewheeling cannot be switched on or off or if the trigger state is incorrect.	Freewheeling of valve driver cannot be switched OR Trigger state not correct	= True  = True	Ignition key AND Resistor Measurement Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the valve actuation corresponds to the expected value. The basic valve monitoring is triggered by the coordinator via the control message. A fault is set if the valve actuation is different from the expected value for a calibrated period of time.	Valve actuation	≠ expected value	Ignition key AND Resistor Measurement Test	= On  = Off	0.03 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the current through a valve is too high or too low. A fault is set if the valve current is above a calibrated threshold_1 or below a calibrated threshold_2 for a calibrated number of failed tests.	(Current through the valve OR Current through the valve) AND Both for a number of failed tests	> 0.12 A  < 0.085 A  > 5	Ignition key AND Leakage Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks the voltage at the output Qx or at the gate to detect if the Valve-Driver-ASIC (Application Specific Integrated Circuit) output driver is not functioning correctly. All PWM (Pulse Width Modulation) signal positive edges are counted, and the low time duration is measured. The resulting value is read out via SPI (Serial Peripheral Interface). The high and low limits of the real PWM signal, which are set by the output driver, are calculated using the measured number of edges and the low time. The calculated high and low limits depend on the activation used. A fault is set if the current activation value is outside the calculated limits.	Measured actuation duty OR Measured actuation duty AND Both for a number of times	< Set Actuation Duty - 20%  > Set Actuation Duty + 20%  > 5	Ignition key AND Resistor Measurement Test AND Leakage Test AND Valve Activation Register Test AND Silent Valve Driver Test	= On  = Off  = Off  = Off	0.05 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the transistor gates are set properly. Qx is the command sent to the transistor gate which commands the valve motor. The Qx monitor compares the expected value of Qx (the calculated Qx-ON/OFF value which is dependent on the current set valve activation) with the actual value of Qx (Qx-ON/OFF from the valve-related SPI (Serial Peripheral Interface) register) in order to check for correct output driver functionality (gate on/off). A fault is set if the actual Qx value does not match the expected Qx value.	(Measured Gate On Actuation Duty OR Measured Gate Off Actuation Duty) AND For a number of failed tests	< 95 %  > 5 %  > 5	Ignition key AND Resistor Measurement Test AND Leakage Test AND Valve Activation Register Test AND Silent Valve Driver Test	= On  = Off  = Off  = Off  = Off	0.03 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the valve-related resistor value is out of range during the resistor measurement. This resistor value is calculated by taking the mean of the voltage through the resistor. A fault is set if the valve resistor value is too high or too low.	Comparison of calculated resistance and measured resistance OR Comparison of calculated resistance and measured resistance AND For a number of times	> 0.2 Of calculated resistance  < -0.2 Of calculated resistance  > 2	Ignition key AND Resistor Measurement Test	= On  = On	0.015 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if there is a short circuit between valves or a defective coil (due to Valve-Driver-ASIC (Application Specific Integrated Circuit) internal failure such as OpenLoad, UnderCurrent, OverCurrent, OverTemp, PGndLost or DxLost) during the Valve-Driver-ASIC Silent Valve Driver Test (SVDT). A fault is set if the ASIC current or temperature is below a calibrated threshold_1 or above a calibrated threshold_2, or if the High Side Switch Line Loss is below a calibrated threshold, for a calibrated number of failed tests.	(Current at ASIC OR Current at ASIC OR Temperature at ASIC OR Temperature at ASIC OR High Side Switch Line Loss) AND For a number of times	< 0.05 A  > 0.14 A  < 25 °C  > 140 °C  < 0.005 A  > 2	Ignition key AND Silent Valve Driver Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the internal valve-driver-ASIC (Application Specific Integrated Circuit) register matches the current actuation during the Valve Actuation Register Test (VART). A fault is set if the measured gate actuation duty during the test actuation exceeds a calibrated threshold.	Measured gate actuation during test actuation AND For a number of times	< 0.005 A  > 2	Ignition key AND Valve Activation Register Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Left Rear Outlet Control	C0019	This monitoring strategy checks if the valve actuation corresponds to the expected value. The basic valve monitoring is triggered by the coordinator via the control message. A fault is set if the valve actuation is different from the expected value for a calibrated period of time.	Valve actuation	≠ expected value	Ignition key AND Resistor Measurement Test	= On  = Off	0.03 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the current through a valve is too high or too low. A fault is set if the valve current is above a calibrated threshold_1 or below a calibrated threshold_2 for a calibrated number of failed tests.	(Current through the valve OR Current through the valve) AND Both for a number of failed tests	> 0.12 A  < 0.085 A  > 5	Ignition key AND Leakage Test	= On  = On	0.015 [Sec]	Type A, 1 Trip

(Current at ASIC OR Current at ASIC OR Temperature at ASIC OR Temperature at ASIC OR High Side Switch Line Loss) AND For a number of times	< 0.05 A  > 0.14 A  < 25 °C  > 140 °C  < 0.005 A  > 2	Ignition key AND Silent Valve Driver Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the internal valve-driver-ASIC (Application Specific Integrated Circuit) register matches the current actuation during the Valve Actuation Register Test (VART). A fault is set if the measured gate actuation duty during the test actuation exceeds a calibrated threshold.	Measured gate actuation during test actuation AND For a number of times	< 0.005 A  > 2	Ignition key AND Valve Activation Register Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Left Rear Wheel Speed Sensor Circuit High	C050F	This monitoring strategy checks if there is a shortcut of WSS signal line to the battery.	Voltage of WSS signal line	> 12 V	System voltage AND Wheel speed sensor test completed	> 6.9 V  = True	0.12 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Left Rear Wheel Speed Sensor Circuit Low	C050E	This monitoring strategy checks for a line failure on the rear left wheel speed sensor. In the line monitor, if a failure is detected, ASIC registers are evaluated and the corresponding failures are set. A fault is set if no precise line failure can be determine.	A failure is detected AND Wheel Speed Sensor Current Supply Line Monitoring AND Wheel Speed Sensor Voltage Monitoring AND Wheel Speed Sensor Current Signal Line Monitoring	= True  = False  = False  = False	System voltage AND Wheel speed sensor test completed	> 6.9 V  = True	0.12 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if there is an electrical failure in the wheel speed sensors. The sensor current and the sensor voltage are monitored by a comparator circuit in an ASIC (Application Specific Integrated Circuit). A fault is set if the current at the supply line is below a calibrated threshold.	Sensor current at supply line	< 0.16 A	System voltage AND Wheel speed sensor test completed	> 6.9 V  = True	0.12 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Left Rear Wheel Speed Sensor Circuit/Open	C050C	This monitoring strategy checks if there is an electrical failure in the wheel speed sensors. The sensor current and the sensor voltage are monitored by a comparator circuit in an ASIC (Application Specific Integrated Circuit). A fault is set if the sensor current at the signal line is below a calibrated threshold.	Sensor current at the signal line	< 0.0038 A	System voltage AND Wheel speed sensor test completed	> 6.9 V  = True	0.12 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Left Rear Wheel Speed Sensor Incorrect Component Installed	C0557	This monitoring strategy checks if the Wheel Speed Sensor (WSS) is mounted at the correct wheel. Since the WSS signals differ for different WSS sensor types, the EBCU (Electronic Brake Control Unit) is able to recognize incorrect WSS placement by evaluating the signal. The intelligent WSS signal provides additional information (air gap) encoded in bits 0-8. Each detection event is followed by a stop pulse. A fault is set if the stop pulse is missing for a calibrated period of time.	No stop pulse according to wheel speed sensor protocol detected	= True	Wheel speed sensor test completed AND Ignition key	= True  = On	3 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Left Rear Wheel Speed Sensor Intermittent/Erratic	C0510	This monitoring strategy checks if the High End Timer Transfer Unit (HETTU) buffer has overflowed. The HETTU buffer stores the time stamp of the wheel speed sensor outputs. This buffer has a status which tells whether the buffer can be used or not. A common PIC (Programmable Interrupt Controller) checks if the HETTU buffer is in the overflow state. In this case the buffer cannot be used because more edges occur on the wheel speed sensor channels than the buffer can store. A fault is set if the HETTU buffer is in the overflow state.	HET TU buffer state	= Overflow	Ignition key	= On	0.03 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Left Rear Wheel Speed Sensor Range/Performance	C050D	This monitoring strategy checks if there is a defective wheel speed sensor. A fault is set if the speed of one wheel speed sensor is zero and the other wheel speed sensor values are above a calibrated threshold. Additionally the vehicle speed has to be above a calibrated threshold.	Speed of 1 wheel AND Speed of 3 wheels	= 0 mph  > 0 mph	Ignition key AND Anti-Lock Braking intervention AND Vehicle speed AND System voltage AND Traction Control System Intervention	= On  = False  > 11.8 mph  > 6.9 V  = False	Immediately	Type A, 1 Trip
		This monitoring strategy checks if the wheel speed sensors is defective. It can be done after standstill, start-up monitoring at low speed, as well as while driving, start-up monitoring at high speed. The main principle of the start-up monitoring is to compare the speed signal from all four wheels to each other. A fault is set if the speed of the monitored wheel is below a calibrated threshold while the speed of the other wheels is above a calibrated threshold.	FR, FL, RR Wheel speed sensor AND RL Wheel speed sensor	> 7.45 mph  = 0 mph	Check at low speed: Initial vehicle speed AND Anti-Lock Braking System intervention AND Traction control system intervention OR Check at high speed: Anti-Lock Braking System intervention AND Traction control system intervention	< 1.8 mph  = False  = False  = False  = False	Immediately	Type A, 1 Trip
		This monitoring strategy checks if the wheel speed signal is missing due to faulty wheel speed information. A fault is set if the wheel speed signal is missing for a calibrated duration ( $\Delta t$ ) and the wheel deceleration is below a calibrated threshold.	No wheel speed signal for a time AND Wheel deceleration	> 0.08 Sec  < 300 m/Sec <sup>2</sup>	Ignition key AND Anti-Lock Braking intervention AND Vehicle speed AND System voltage AND Traction Control System Intervention AND Hydroplaning detected	= On  = False  > 26.84 mph  > 6.9 V  = False  = False	0.08 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the wheel speed sensor PWM (Pulse Width Modulation) is functioning correctly. The wheel speed sensor returns a PWM signal with a frequency which is dependent on the vehicle velocity. The vehicle velocity is determined by counting every rising-edge of the signal periodically for a fixed time. A threshold is calculated with the two last rising-edges values to filter a missing edge value due to high deceleration. A fault is set if the number of rising-edges for the next cycle is lower than this calculated threshold. This monitor uses rough road detection to distinguish gaps in the edge cycle signal caused by real faults from those caused by driving on rough roads.	Number of rising-edge per cycle	< Threshold calculated by mean of the two latest edge- cycle	Vehicle speed AND Vehicle speed AND Anti-lock Brake System Interventions AND System voltage AND Ignition key	> 6.21 mph  < 37.36 mph  = False  > 6.9 V  = On	Immediately	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks for a discontinuous wheel speed sensor signal, caused for example by impulse wheel vibration. The vibrations induce additional frequencies to the wheel speed sensor signal. The noise monitoring consists of three checks which lead to a noise fault. The first check evaluates the acceleration of each wheel speed sensor. The second check evaluates the amplitude of the noise events. A weighing factor is calculated according to the noise amplitude value. The third check evaluates the number of edges. A fault is set if two implausible high wheel speed accelerations occur within a calibrated duration, if the wheel speed acceleration is above a calibrated threshold, if the accumulation of the weighted noise amplitude is above a calibrated threshold during the actual driving cycle, or if the number of detected edges increases above a calibrated threshold within a calibrated period of time.	W/hel acceleration AND For a calibrated number of counts For time OR W/hel acceleration AND Accumulation of the weighted noise amplitude in current driving cycle OR Number of detected edges increases from To For time	> 9.81 m/Sec^2  = 2 < 1.2 Sec  > 500 m/Sec^2  > 4  < 3 > 5 < 0.005 Sec	System voltage AND Ignition key	> 6.9 V  = On	20 [Sec]	Type A, 1 Trip
		This monitoring strategy checks each wheel speed sensor signal for implausibly high wheel speed values. A fault is set if the wheel speed signal value is above a calibrated threshold for a calibrated duration.	Measured wheel speed For time	> 183.9 mph > 5.04 Sec	System voltage AND Ignition key	> 6.9 V  = On	5.04 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the difference between the wheel speed sensor signals is within a range. A fault is set if the difference in wheel speed between a single wheel speed sensor and all other wheel speed sensors is above a calibrated threshold. If the vehicle speed is below a calibrated value, the malfunction threshold is a fixed value. If the vehicle speed is above this calibrated value, the malfunction threshold is proportional to the actual vehicle speed.	Difference between maximum and minimum wheel speed for vehicle speed OR Difference between maximum and minimum wheel speed for vehicle speed	> 3.7 mph < 12.4 mph  > 6 % > 12.4 mph	Ignition key	= On	72 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the Wheel Speed Sensor (WSS) is mounted properly. This monitor continuously evaluates continuously the distance between the impulse wheel and the WSS. The WSS evaluates the magnetic flux density to detect an air gap failure. A fault is set if the air gap is too large which is indicated by a magnetic flux density below a calibrated threshold for a calibrated number of wheel rotations.	Magnetic flux density AND for a number of wheel rotations	< 0.0022 T  > 4	Ignition key AND Wheel speed sensor test completed	= On  = True	0.1 [Sec]	Type A, 1 Trip

Powertrain Control Module Indicated Requested Torque	C10EA	This monitoring strategy checks if the electric power train response(actual regenerative brake torque) does not correspond to the target regenerative brake torque, or if the signal transmission from the power train ECU (Electronic Control Unit) to the brake system ECU failed. A Fault is set if the electric power train has applied regenerative braking without the request of the brake system ECU.	(Actual regenerative brake torque signal value - Target regenerative brake torque)	> 700 Nm	Full system mode AND Regenerative braking OR Unintended regenerative braking was executed	= On  = On  = True	0.8 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if the electric power train response(actual regenerative brake torque) does not correspond to the target regenerative brake torque, or if the signal transmission from the power train ECU (Electronic Control Unit) to the brake system ECU failed. In case of a braking situation, the ECU calculates the proportion of regenerative brake torque to non-regenerative brake torque. Then the regenerative brake torque must reach the regenerative brake torque request from the ECU. A fault is set if the actual regenerative brake torque provided by the electric power train ECU deviates by more than a certain amount from the target regenerative brake torque requested by the brake system.	(Actual regenerative brake torque signal value - Target regenerative brake torque)	> 700 Nm	Full system mode AND Regenerative braking is being requested OR Response of electricpowertrain does not match request	= On  = True  = True	0.8 [Sec]	Type A, 1 Trip
		DTC Pass	Turn on ignition. 1. Accelerate moderate to 24.8 mph and Brake to standstill with low decelerataion (brake time about 15sec), 2. Accelerate moderate to 24.8 mph and Brake to standstill with middle decelerataion (brake time about 7.5sec), 3. Accelerate moderate to 24.8 mph and Brake to standstill with low decelerataion (brake time about 15sec), 4. Accelerate moderate to 24.8 mph and Brake to standstill with middle decelerataion (brake					
Pump Motor Relay Circuit High	C106B	This monitoring strategy checks if the hydraulic pump has an electrical fault. When the pump is not running. The monitor checks the voltage difference between MRD and MRS voltage and the current across the motor while the pump is activated. A fault is set if the voltage is greater than a calibrated threshold.	During motor actuation. Absolute (Hydraulic pump motor relay drain voltage - hydraulic pump motor relay source voltage)	> 2 V	Ignition key AND Hydraulic pump motor AND System voltage	= On  = On  > 6.9 V	0.06 [Sec]	Type A, 1 Trip
		DTC Pass	Drive off, accelerate up to 37.2 mph and maintain this speed for at least 5s					
Pump Motor Relay Circuit Low	C106A	This monitoring strategy checks if there is an overload situation on the motor relay during actuation. A fault is set if the hydraulic pump motor relay cannot be switched-through completely. This happens when the voltage between the Motor Relay Drain (MRD) and the Motor Relay Source (MRS) is greater than a calibrated threshold.	During motor actuation. Absolute (Hydraulic pump motor relay drain voltage - hydraulic pump motor relay source voltage)	> 0.5 V	Ignition key AND Hydraulic pump motor AND System voltage	= On  = On  > 6.9 V	0.06 [Sec]	Type A, 1 Trip
		DTC Pass	Drive off, accelerate up to 37.2 mph and maintain this speed for at least 5s					

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Regenerative Braking Axle Torque Achieved Message Counter Incorrect	C1287	This monitoring strategy checks whether the message is still alive or not. The network driver has to send and receive all network messages. At the same time it has to check that the messages are correct (length, checksum, alive-counter, reception timeout). With each newly sent message a counter is incremented within the sending ECU. The counter value is enclosed within the message. The receiving control unit checks whether counters have been incremented. A fault is set if the counter value is not incremented.	Message 0x230 on Bus E counter halted	= True	System voltage AND System voltage AND Bus Off Fault Active ECU is sending/receiving on CAN AND ECU Power Mode transition diagnostic enable delay timer	> 7.5 V  < 16 V  = False = True  ≥ 5 Sec	0.25 [Sec]	Type B, 2 Trips
		This monitoring strategy checks if the message checksum is correct. The network driver sends and receives all network messages. It also checks if the messages are correct (length, checksum, alive-counter, reception timeout). With each newly sent message a checksum is calculated within the sending ECU. The value of the checksum is enclosed within the message. The receiving control unit calculates the checksum again and compares it with the sent one. A fault is set if the received checksum is different from the calculated checksum.	Checksum of 0x230 on Bus E not correct	= True	System voltage AND System voltage AND Bus Off Fault Active ECU is sending/receiving on CAN AND ECU Power Mode transition diagnostic enable delay timer	> 7.5 V  < 16 V  = False = True  ≥ 5 Sec	0.25 [Sec]	Type B, 2 Trips
Right Front Inlet Control	C0014	This monitoring strategy checks if the Valve-Driver-ASIC (Application Specific Integrated Circuit) FreeWheeling component is defective. A fault is set if the valve driver freewheeling cannot be switched on or off or if the trigger state is incorrect.	Freewheeling of valve driver cannot be switched OR Trigger state not correct	= True  = True	Ignition key AND Resistor Measurement Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the valve actuation corresponds to the expected value. The basic valve monitoring is triggered by the coordinator via the control message. A fault is set if the valve actuation is different from the expected value for a calibrated period of time.	Valve actuation	≠ expected value	Ignition key AND Resistor Measurement Test	= On  = Off	0.03 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the current through a valve is too high or too low. A fault is set if the valve current is above a calibrated threshold_1 or below a calibrated threshold_2 for a calibrated number of failed tests.	(Current through the valve OR Current through the valve) AND Both for a number of failed tests	> 0.12 A  < 0.085 A  > 5	Ignition key AND Leakage Test	= On  = On	0.015 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks the voltage at the output Qx or at the gate to detect if the Valve-Driver-ASIC (Application Specific Integrated Circuit) output driver is not functioning correctly. All PWM (Pulse Width Modulation) signal positive edges are counted, and the low time duration is measured. The resulting value is read out via SPI (Serial Peripheral Interface). The high and low limits of the real PWM signal, which are set by the output driver, are calculated using the measured number of edges and the low time. The calculated high and low limits depend on the activation used. A fault is set if the current activation value is outside the calculated limits.	Measured actuation duty OR Measured actuation duty AND Both for a number of times	< Set Actuation Duty - 20%  > Set Actuation Duty + 20%  > 5	Ignition key AND Resistor Measurement Test AND Leakage Test AND Valve Activation Register Test AND Silent Valve Driver Test	= On  = Off  = Off  = Off	0.05 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the transistor gates are set properly. Qx is the command sent to the transistor gate which commands the valve motor. The Qx monitor compares the expected value of Qx (the calculated Qx-ON/OFF value which is dependent on the current set valve activation) with the actual value of Qx (Qx-ON/OFF from the valve-related SPI (Serial Peripheral Interface) register) in order to check for correct output driver functionality (gate on/off). A fault is set if the actual Qx value does not match the expected Qx value.	(Measured Gate On Actuation Duty OR Measured Gate Off Actuation Duty) AND For a number of failed tests	< 95 %  > 5 %  > 5	Ignition key AND Resistor Measurement Test AND Leakage Test AND Valve Activation Register Test AND Silent Valve Driver Test	= On  = Off  = Off  = Off	0.03 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the valve-related resistor value is out of range during the resistor measurement. This resistor value is calculated by taking the mean of the voltage through the resistor. A fault is set if the valve resistor value is too high or too low.	Comparison of calculated resistance and measured resistance OR Comparison of calculated resistance and measured resistance AND For a number of times	> 0.2 Of calculated resistance  < -0.2 Of calculated resistance  > 2	Ignition key AND Resistor Measurement Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if there is a short circuit between valves or a defective coil (due to Valve-Driver-ASIC (Application Specific Integrated Circuit) internal failure such as OpenLoad, UnderCurrent, OverCurrent, OverTemp, PGndLost or DxLost) during the Valve-Driver-ASIC Silent Valve Driver Test (SVDT). A fault is set if the ASIC current or temperature is below a calibrated threshold_1 or above a calibrated threshold_2, or if the High Side Switch Line Loss is below a calibrated threshold, for a calibrated number of failed tests.	(Current at ASIC OR Current at ASIC OR Temperature at ASIC OR Temperature at ASIC OR High Side Switch Line Loss) AND For a number of times	< 0.05 A  > 0.14 A  < 25 °C  > 140 °C  < 0.005 A  > 2	Ignition key AND Silent Valve Driver Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the internal valve-driver-ASIC (Application Specific Integrated Circuit) register matches the current actuation during the Valve Actuation Register Test (VART). A fault is set if the measured gate actuation duty during the test actuation exceeds a calibrated threshold.	Measured gate actuation during test actuation AND For a number of times	< 0.005 A  > 2	Ignition key AND Valve Activation Register Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if there is a short circuit between valves or a defective coil (due to Valve-Driver-ASIC (Application Specific Integrated Circuit) internal failure such as OpenLoad, UnderCurrent, OverCurrent, OverTemp, PGndLost or DxLost) during the Valve-Driver-ASIC Silent Valve Driver Test (SVDT). A fault is set if the ASIC current or temperature is below a calibrated threshold_1 or above a calibrated threshold_2, or if the High Side Switch Line Loss is below a calibrated threshold, for a calibrated number of failed tests.	(Current at ASIC OR Current at ASIC OR Temperature at ASIC OR Temperature at ASIC OR High Side Switch Line Loss) AND For a number of times	< 0.05 A  > 0.14 A  < 25 °C  > 140 °C  < 0.005 A  > 2	Ignition key AND Silent Valve Driver Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the internal valve-driver-ASIC (Application Specific Integrated Circuit) register matches the current actuation during the Valve Actuation Register Test (VART). A fault is set if the measured gate actuation duty during the test actuation exceeds a calibrated threshold.	Measured gate actuation during test actuation AND For a number of times	< 0.005 A  > 2	Ignition key AND Valve Activation Register Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Right Front Wheel Speed Sensor Circuit High	C0509	This monitoring strategy checks if there is a shortcut of WSS signal line to the battery.	Voltage of WSS signal line	> 12 V	System voltage AND Wheel speed sensor test completed	> 6.9 V  = True	0.12 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Right Front Wheel Speed Sensor Circuit Low	C0508	This monitoring strategy checks for a line failure on the front right wheel speed sensor. In the line monitor, if a failure is detected, ASIC registers are evaluated and the corresponding failures are set. A fault is set if no precise line failure can be determine.	A failure is detected AND Wheel Speed Sensor Current Supply Line Monitoring AND Wheel Speed Sensor Voltage Monitoring AND Wheel Speed Sensor Current Signal Line Monitoring	= True  = False  = False  = False	System voltage AND Wheel speed sensor test completed	> 6.9 V  = True	0.12 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if there is an electrical failure in the wheel speed sensors. The sensor current and the sensor voltage are monitored by a comparator circuit in an ASIC (Application Specific Integrated Circuit). A fault is set if the current at the supply line is below a calibrated threshold.	Sensor current at supply line	< 0.16 A	System voltage AND Wheel speed sensor test completed	> 6.9 V  = True	0.12 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Right Front Wheel Speed Sensor Circuit/Open	C0506	This monitoring strategy checks if there is an electrical failure in the wheel speed sensors. The sensor current and the sensor voltage are monitored by a comparator circuit in an ASIC (Application Specific Integrated Circuit). A fault is set if the sensor current at the signal line is below a calibrated threshold.	Sensor current at the signal line	< 0.0038 A	System voltage AND Wheel speed sensor test completed	> 6.9 V  = True	0.12 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Right Front Wheel Speed Sensor Incorrect Component Installed	C0556	This monitoring strategy checks if the Wheel Speed Sensor (WSS) is mounted at the correct wheel. Since the WSS signals differ for different WSS sensor types, the EBCU (Electronic Brake Control Unit) is able to recognize incorrect WSS placement by evaluating the signal. The intelligent WSS signal provides additional information (air gap) encoded in bits 0-8. Each detection event is followed by a stop pulse. A fault is set if the stop pulse is missing for a calibrated period of time.	No stop pulse according to wheel speed sensor protocol detected	= True	Wheel speed sensor test completed AND Ignition key	= True  = On	3 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Right Front Wheel Speed Sensor Intermittent/Erratic	C050A	This monitoring strategy checks if the High End Timer Transfer Unit (HETTU) buffer has overflowed. The HETTU buffer stores the time stamp of the wheel speed sensor outputs. This buffer has a status which tells whether the buffer can be used or not. A common PIC (Programmable Interrupt Controller) checks if the HETTU buffer is in the overflow state. In this case the buffer cannot be used because more edges occur on the wheel speed sensor channels than the buffer can store. A fault is set if the HETTU buffer is in the overflow state.	HET TU buffer state	= Overflow	Ignition key	= On	0.03 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Right Front Wheel Speed Sensor Range/Performance	C0507	This monitoring strategy checks if there is a defective wheel speed sensor. A fault is set if the speed of one wheel speed sensor is zero and the other wheel speed sensor values are above a calibrated threshold. Additionally the vehicle speed has to be above a calibrated threshold.	Speed of 1 wheel AND Speed of 3 wheels	= 0 mph  > 0 mph	Ignition key AND Anti-Lock Braking intervention AND Vehicle speed AND System voltage AND Traction Control System Intervention	= On  = False  > 11.8 mph  > 6.9 V  = False	Immediately	Type A, 1 Trip
		This monitoring strategy checks if the wheel speed sensors is defective. It can be done after standstill, start-up monitoring at low speed, as well as while driving, start-up monitoring at high speed. The main principle of the start-up monitoring is to compare the speed signal from all four wheels to each other. A fault is set if the speed of the monitored wheel is below a calibrated threshold while the speed of the other wheels is above a calibrated threshold.	FL, RL, RR Wheel speed sensor AND FR Wheel speed sensor	> 7.45 mph  = 0 mph	Check at low speed: Initial vehicle speed AND Anti-Lock Braking System intervention AND Traction control system intervention OR Check at high speed: Anti-Lock Braking System intervention AND Traction control system intervention	< 1.8 mph  = False  = False  = False  = False	Immediately	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if the wheel speed signal is missing due to faulty wheel speed information. A fault is set if the wheel speed signal is missing for a calibrated duration ( $\Delta t$ ) and the wheel deceleration is below a calibrated threshold.	No wheel speed signal for a time AND Wheel deceleration	> 0.08 Sec  < 300 m/Sec <sup>2</sup>	Ignition key AND Anti-Lock Braking intervention AND Vehicle speed AND System voltage AND Traction Control System Intervention AND Hydroplaning detected	= On  = False  > 26.84 mph  > 6.9 V  = False  = False	0.08 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the wheel speed sensor PWM (Pulse Width Modulation) is functioning correctly. The wheel speed sensor returns a PWM signal with a frequency which is dependent on the vehicle velocity. The vehicle velocity is determined by counting every rising-edge of the signal periodically for a fixed time. A threshold is calculated with the two last rising-edges values to filter a missing edge value due to high deceleration. A fault is set if the number of rising-edges for the next cycle is lower than this calculated threshold. This monitor uses rough road detection to distinguish gaps in the edge cycle signal caused by real faults from those caused by driving on rough roads.	Number of rising-edge per cycle	< Threshold calculated by mean of the two latest edge- cycle	Vehicle speed AND Vehicle speed AND Anti-lock Brake System Interventions AND System voltage AND Ignition key	> 6.21 mph  < 37.36 mph  = False  > 6.9 V  = On	Immediately	Type A, 1 Trip
		This monitoring strategy checks for a discontinuous wheel speed sensor signal, caused for example by impulse wheel vibration. The vibrations induce additional frequencies to the wheel speed sensor signal. The noise monitoring consists of three checks which lead to a noise fault. The first check evaluates the acceleration of each wheel speed sensor. The second check evaluates the amplitude of the noise events. A weighing factor is calculated according to the noise amplitude value. The third check evaluates the number of edges. A fault is set if two implausible high wheel speed accelerations occur within a calibrated duration, if the wheel speed acceleration is above a calibrated threshold, if the accumulation of the weighted noise amplitude is above a calibrated threshold during the actual driving cycle, or if the number of detected edges increases above a calibrated threshold within a calibrated period of time.	Wheel acceleration AND For a calibrated number of counts For time OR Wheel acceleration AND Accumulation of the weighted noise amplitude in current driving cycle OR Number of detected edges increases from To For time	> 9.81 m/Sec <sup>2</sup>  = 2 For time < 1.2 Sec  > 500 m/Sec <sup>2</sup>  > 4  < 3 > 5 < 0.005 Sec	System voltage AND Ignition key	> 6.9 V  = On	20 [Sec]	Type A, 1 Trip
		This monitoring strategy checks each wheel speed sensor signal for implausibly high wheel speed values. A fault is set if the wheel speed signal value is above a calibrated threshold for a calibrated duration.	Measured wheel speed For time	> 183.9 mph > 5.04 Sec	System voltage AND Ignition key	> 6.9 V  = On	5.04 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if the difference between the wheel speed sensor signals is within a range. A fault is set if the difference in wheel speed between a single wheel speed sensor and all other wheel speed sensors is above a calibrated threshold. If the vehicle speed is below a calibrated value, the malfunction threshold is a fixed value. If the vehicle speed is above this calibrated value, the malfunction threshold is proportional to the actual vehicle speed.	Difference between maximum and minimum wheel speed for vehicle speed OR Difference between maximum and minimum wheel speed for vehicle speed	> 3.7 mph < 12.4 mph  > 6 % > 12.4 mph	Ignition key	= On	72 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the Wheel Speed Sensor (WSS) is mounted properly. This monitor continuously evaluates continuously the distance between the impulse wheel and the WSS. The WSS evaluates the magnetic flux density to detect an air gap failure. A fault is set if the air gap is too large which is indicated by a magnetic flux density below a calibrated threshold for a calibrated number of wheel rotations.	Magnetic flux density AND for a number of wheel rotations	< 0.0022 T  > 4	Ignition key AND Wheel speed sensor test completed	= On  = True	0.1 [Sec]	Type A, 1 Trip
		The monitoring checks if the stop pulse from each wheel speed sensor (WSS) is detected. The intelligent WSS signal provides additional information (air gap) encoded in bits 0-8. Each detection event is followed by a stop pulse. A fault is set if the Application Specific Integrated Circuit (ASIC) does not detect a stop pulse after some time and if there is no level change on the wheel speed sensor signal for some time.	No stop pulse detected For time OR No level change on signal For time	= True > 0.15 Sec  = True > 3.5 Sec	Vehicle speed AND For time AND Wheel speed sensor test completed	< 1.12 mph  > 10 Sec  = True	3.5 [Sec]	Type A, 1 Trip
		This monitoring strategy checks the supply voltage of the corresponding wheel speed sensor. Each wheel speed sensor is switched on separately. A fault is set if the sensor supply voltage is below a calibrated threshold during the initial phase.	Sensor supply voltage of the respective wheel speed sensor	< 11 V	Ignition key AND System voltage AND	= On  > 6.9 V	0.035 [Sec]	Type A, 1 Trip
		DTC Pass	Accelerate vehicle to at least 37.3 mph and hold the speed for at least 7s					
Right Rear Inlet Control	C001C	This monitoring strategy checks if the Valve-Driver-ASIC (Application Specific Integrated Circuit) FreeWheeling component is defective. A fault is set if the valve driver freewheeling cannot be switched on or off or if the trigger state is incorrect.	Freewheeling of valve driver cannot be switched OR Trigger state not correct	= True  = True	Ignition key AND Resistor Measurement Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the valve actuation corresponds to the expected value. The basic valve monitoring is triggered by the coordinator via the control message. A fault is set if the valve actuation is different from the expected value for a calibrated period of time.	Valve actuation	≠ expected value	Ignition key AND Resistor Measurement Test	= On  = Off	0.03 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

		This monitoring strategy checks if the current through a valve is too high or too low. A fault is set if the valve current is above a calibrated threshold_1 or below a calibrated threshold_2 for a calibrated number of failed tests.	(Current through the valve OR Current through the valve) AND Both for a number of failed tests	> 0.12 A  < 0.085 A  > 5	Ignition key AND Leakage Test	= On  = On	0.015 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks the voltage at the output Qx or at the gate to detect if the Valve-Driver-ASIC (Application Specific Integrated Circuit) output driver is not functioning correctly. All PWM (Pulse Width Modulation) signal positive edges are counted, and the low time duration is measured. The resulting value is read out via SPI (Serial Peripheral Interface). The high and low limits of the real PWM signal, which are set by the output driver, are calculated using the measured number of edges and the low time. The calculated high and low limits depend on the activation used. A fault is set if the current activation value is outside the calculated limits.	Measured actuation duty OR Measured actuation duty AND Both for a number of times	< Set Actuation Duty - 20%  > Set Actuation Duty + 20%  > 5	Ignition key AND Resistor Measurement Test AND Leakage Test AND Valve Activation Register Test AND Silent Valve Driver Test	= On  = Off  = Off  = Off	0.05 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the transistor gates are set properly. Qx is the command sent to the transistor gate which commands the valve motor. The Qx monitor compares the expected value of Qx (the calculated Qx-ON/OFF value which is dependent on the current set valve activation) with the actual value of Qx (Qx-ON/OFF from the valve-related SPI (Serial Peripheral Interface) register) in order to check for correct output driver functionality (gate on/off). A fault is set if the actual Qx value does not match the expected Qx value.	(Measured Gate On Actuation Duty OR Measured Gate Off Actuation Duty) AND For a number of failed tests	< 95 %  > 5 %  > 5	Ignition key AND Resistor Measurement Test AND Leakage Test AND Valve Activation Register Test AND Silent Valve Driver Test	= On  = Off  = Off  = Off	0.03 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the valve-related resistor value is out of range during the resistor measurement. This resistor value is calculated by taking the mean of the voltage through the resistor. A fault is set if the valve resistor value is too high or too low.	Comparison of calculated resistance and measured resistance OR Comparison of calculated resistance and measured resistance AND For a number of times	> 0.2 Of calculated resistance  < -0.2 Of calculated resistance  > 2	Ignition key AND Resistor Measurement Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if there is a short circuit between valves or a defective coil (due to Valve-Driver-ASIC (Application Specific Integrated Circuit) internal failure such as OpenLoad, UnderCurrent, OverCurrent, OverTemp, PGndLost or DxLost) during the Valve-Driver-ASIC Silent Valve Driver Test (SVDT). A fault is set if the ASIC current or temperature is below a calibrated threshold_1 or above a calibrated threshold_2, or if the High Side Switch Line Loss is below a calibrated threshold, for a calibrated number of failed tests.	(Current at ASIC OR Current at ASIC OR Temperature at ASIC OR Temperature at ASIC OR High Side Switch Line Loss) AND For a number of times	< 0.05 A  > 0.14 A  < 25 °C  > 140 °C  < 0.005 A  > 2	Ignition key AND Silent Valve Driver Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the internal valve-driver-ASIC (Application Specific Integrated Circuit) register matches the current actuation during the Valve Actuation Register Test (VART). A fault is set if the measured gate actuation duty during the test actuation exceeds a calibrated threshold.	Measured gate actuation during test actuation AND For a number of times	< 0.005 A  > 2	Ignition key AND Valve Activation Register Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if there is a short circuit between valves or a defective coil (due to Valve-Driver-ASIC (Application Specific Integrated Circuit) internal failure such as OpenLoad, UnderCurrent, OverCurrent, OverTemp, PGndLost or DxLost) during the Valve-Driver-ASIC Silent Valve Driver Test (SVDT). A fault is set if the ASIC current or temperature is below a calibrated threshold_1 or above a calibrated threshold_2, or if the High Side Switch Line Loss is below a calibrated threshold, for a calibrated number of failed tests.	(Current at ASIC OR Current at ASIC OR Temperature at ASIC OR Temperature at ASIC OR High Side Switch Line Loss) AND For a number of times	< 0.05 A  > 0.14 A  < 25 °C  > 140 °C  < 0.005 A  > 2	Ignition key AND Silent Valve Driver Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the internal valve-driver-ASIC (Application Specific Integrated Circuit) register matches the current actuation during the Valve Actuation Register Test (VART). A fault is set if the measured gate actuation duty during the test actuation exceeds a calibrated threshold.	Measured gate actuation during test actuation AND For a number of times	< 0.005 A  > 2	Ignition key AND Valve Activation Register Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Right Rear Wheel Speed Sensor Circuit High	C0515	This monitoring strategy checks if there is a shortcut of WSS signal line to the battery.	Voltage of WSS signal line	> 12 V	System voltage AND Wheel speed sensor test completed	> 6.9 V  = True	0.12 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Right Rear Wheel Speed Sensor Circuit Low	C0514	This monitoring strategy checks for a line failure on the rear right wheel speed sensor. In the line monitor, if a failure is detected, ASIC registers are evaluated and the corresponding failures are set. A fault is set if no precise line failure can be determine.	A failure is detected AND Wheel Speed Sensor Current Supply Line Monitoring AND Wheel Speed Sensor Voltage Monitoring AND Wheel Speed Sensor Current Signal Line Monitoring	= True  = False  = False  = False	System voltage AND Wheel speed sensor test completed	> 6.9 V  = True	0.12 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if there is an electrical failure in the wheel speed sensors. The sensor current and the sensor voltage are monitored by a comparator circuit in an ASIC (Application Specific Integrated Circuit). A fault is set if the current at the supply line is below a calibrated threshold.	Sensor current at supply line	< 0.16 A	System voltage AND Wheel speed sensor test completed	> 6.9 V  = True	0.12 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Right Rear Wheel Speed Sensor Circuit/Open	C0512	This monitoring strategy checks if there is an electrical failure in the wheel speed sensors. The sensor current and the sensor voltage are monitored by a comparator circuit in an ASIC (Application Specific Integrated Circuit). A fault is set if the sensor current at the signal line is below a calibrated threshold.	Sensor current at the signal line	< 0.0038 A	System voltage AND Wheel speed sensor test completed	> 6.9 V  = True	0.12 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Right Rear Wheel Speed Sensor Incorrect Component Installed	C0558	This monitoring strategy checks if the Wheel Speed Sensor (WSS) is mounted at the correct wheel. Since the WSS signals differ for different WSS sensor types, the EBCU (Electronic Brake Control Unit) is able to recognize incorrect WSS placement by evaluating the signal. The intelligent WSS signal provides additional information (air gap) encoded in bits 0-8. Each detection event is followed by a stop pulse. A fault is set if the stop pulse is missing for a calibrated period of time.	No stop pulse according to wheel speed sensor protocol detected	= True	Wheel speed sensor test completed AND Ignition key	= True  = On	3 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Right Rear Wheel Speed Sensor Intermittent/Erratic	C0516	This monitoring strategy checks if the High End Timer Transfer Unit (HETTU) buffer has overflowed. The HETTU buffer stores the time stamp of the wheel speed sensor outputs. This buffer has a status which tells whether the buffer can be used or not. A common PIC (Programmable Interrupt Controller) checks if the HETTU buffer is in the overflow state. In this case the buffer cannot be used because more edges occur on the wheel speed sensor channels than the buffer can store. A fault is set if the HETTU buffer is in the overflow state.	HET TU buffer state	= Overflow	Ignition key	= On	0.03 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Right Rear Wheel Speed Sensor Range/Performance	C0513	This monitoring strategy checks if there is a defective wheel speed sensor. A fault is set if the speed of one wheel speed sensor is zero and the other wheel speed sensor values are above a calibrated threshold. Additionally the vehicle speed has to be above a calibrated threshold.	Speed of 1 wheel AND Speed of 3 wheels	= 0 mph  > 0 mph	Ignition key AND Anti-Lock Braking intervention AND Vehicle speed AND System voltage AND Traction Control System Intervention	= On  = False  > 11.8 mph  > 6.9 V  = False	Immediately	Type A, 1 Trip
		This monitoring strategy checks if the wheel speed sensors is defective. It can be done after standstill, start-up monitoring at low speed, as well as while driving, start-up monitoring at high speed. The main principle of the start-up monitoring is to compare the speed signal from all four wheels to each other. A fault is set if the speed of the monitored wheel is below a calibrated threshold while the speed of the other wheels is above a calibrated threshold.	FR, FL, RL Wheel speed sensor AND RR Wheel speed sensor	> 7.45 mph  = 0 mph	Check at low speed: Initial vehicle speed AND Anti-Lock Braking System intervention AND Traction control system intervention OR Check at high speed: Anti-Lock Braking System intervention AND Traction control system intervention	< 1.8 mph  = False  = False  = False  = False	Immediately	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if the wheel speed signal is missing due to faulty wheel speed information. A fault is set if the wheel speed signal is missing for a calibrated duration ( $\Delta t$ ) and the wheel deceleration is below a calibrated threshold.	No wheel speed signal for a time AND Wheel deceleration	> 0.08 Sec  < 300 m/Sec <sup>2</sup>	Ignition key AND Anti-Lock Braking intervention AND Vehicle speed AND System voltage AND Traction Control System Intervention AND Hydroplaning detected	= On  = False  > 26.84 mph  > 6.9 V  = False  = False	0.08 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the wheel speed sensor PWM (Pulse Width Modulation) is functioning correctly. The wheel speed sensor returns a PWM signal with a frequency which is dependent on the vehicle velocity. The vehicle velocity is determined by counting every rising-edge of the signal periodically for a fixed time. A threshold is calculated with the two last rising-edges values to filter a missing edge value due to high deceleration. A fault is set if the number of rising-edges for the next cycle is lower than this calculated threshold. This monitor uses rough road detection to distinguish gaps in the edge cycle signal caused by real faults from those caused by driving on rough roads.	Number of rising-edge per cycle	< Threshold calculated by mean of the two latest edge- cycle	Vehicle speed AND Vehicle speed AND Anti-lock Brake System Interventions AND System voltage AND Ignition key	> 6.21 mph  < 37.36 mph  = False  > 6.9 V  = On	Immediately	Type A, 1 Trip
		This monitoring strategy checks for a discontinuous wheel speed sensor signal, caused for example by impulse wheel vibration. The vibrations induce additional frequencies to the wheel speed sensor signal. The noise monitoring consists of three checks which lead to a noise fault. The first check evaluates the acceleration of each wheel speed sensor. The second check evaluates the amplitude of the noise events. A weighing factor is calculated according to the noise amplitude value. The third check evaluates the number of edges. A fault is set if two implausible high wheel speed accelerations occur within a calibrated duration, if the wheel speed acceleration is above a calibrated threshold, if the accumulation of the weighted noise amplitude is above a calibrated threshold during the actual driving cycle, or if the number of detected edges increases above a calibrated threshold within a calibrated period of time.	Wheel acceleration AND For a calibrated number of counts For time OR Wheel acceleration AND Accumulation of the weighted noise amplitude in current driving cycle OR Number of detected edges increases from To For time	> 9.81 m/Sec <sup>2</sup>  = 2 < 1.2 Sec  > 500 m/Sec <sup>2</sup>  > 4  < 3 > 5 < 0.005 Sec	System voltage AND Ignition key	> 6.9 V  = On	20 [Sec]	Type A, 1 Trip
		This monitoring strategy checks each wheel speed sensor signal for implausibly high wheel speed values. A fault is set if the wheel speed signal value is above a calibrated threshold for a calibrated duration.	Measured wheel speed For time	> 183.9 mph > 5.04 Sec	System voltage AND Ignition key	> 6.9 V  = On	5.04 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if the difference between the wheel speed sensor signals is within a range. A fault is set if the difference in wheel speed between a single wheel speed sensor and all other wheel speed sensors is above a calibrated threshold. If the vehicle speed is below a calibrated value, the malfunction threshold is a fixed value. If the vehicle speed is above this calibrated value, the malfunction threshold is proportional to the actual vehicle speed.	Difference between maximum and minimum wheel speed for vehicle speed OR Difference between maximum and minimum wheel speed for vehicle speed	> 3.7 mph < 12.4 mph  > 6 % > 12.4 mph	Ignition key	= On	72 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the Wheel Speed Sensor (WSS) is mounted properly. This monitor continuously evaluates continuously the distance between the impulse wheel and the WSS. The WSS evaluates the magnetic flux density to detect an air gap failure. A fault is set if the air gap is too large which is indicated by a magnetic flux density below a calibrated threshold for a calibrated number of wheel rotations.	Magnetic flux density AND for a number of wheel rotations	< 0.0022 T  > 4	Ignition key AND Wheel speed sensor test completed	= On  = True	0.1 [Sec]	Type A, 1 Trip
		The monitoring checks if the stop pulse from the Wheel Speed Sensor of each wheel is detected. The intelligent WSS signal provides additional information (air gap) encoded in bits 0-8. Each detection event is followed by a stop pulse. A fault is set if the Application Specific Integrated Circuit (ASIC) does not detect a stop pulse after some time and if there is no level change on the wheel speed sensor signal for some time.	No stop pulse detected For time OR No level change on signal For time	= True > 0.15 Sec  = True > 3.5 Sec	Vehicle speed AND For time AND Wheel speed sensor test completed	< 1.12 mph  > 10 Sec  = True	3.5 [Sec]	Type A, 1 Trip
		This monitoring strategy checks the supply voltage of the corresponding wheel speed sensor. Each wheel speed sensor is switched on separately. A fault is set if the sensor supply voltage is below a calibrated threshold during the initial phase.	Sensor supply voltage of the respective wheel speed sensor	< 11 V	Ignition key AND System voltage AND	= On  > 6.9 V	0.035 [Sec]	Type A, 1 Trip
		DTC Pass	Accelerate vehicle to at least 37.3 mph and hold the speed for at least 7s					
Software Incompatibility With Brake System Control Module "B" - Generic	U031C	This monitoring checks if there is a mismatch between the iBooster compatibility index signal and the current configuration in ESP. A fault is set if the signal "Ebrake Assist Compatibility Index" is received with an incompatible index value.	"Ebrake Assist Compatibility Index" is received with an incompatible index value	= True	System voltage AND System voltage AND Bus Off Fault Active ECU is sending/receiving on CAN AND ECU Power Mode transition diagnostic enable delay timer	> 7.5 V  < 16 V  = False = True  ≥ 5 Sec	0.1 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
System Voltage	P0560	This monitoring strategy checks if the resistance in the internal valve supply voltage (UBVR) line is faulty or too high by checking the voltage. A supply line failure is detected during the Valve Activation Supply Line Test (VAST). A fault is set if the ratio of internal valve supply voltage to system voltage is above a calibrated threshold.	Internal valve supply voltage / System voltage	> 0.25	Vehicle speed AND Ignition key AND System voltage	> 9.32 mph  = On  > 6.9 V	0.015 [Sec]	Type A, 1 Trips
		DTC Pass	Accelerate vehicle to at least 18.6 mph and hold the speed for at least 20s					
System Voltage High	P0563	This monitoring checks the system supply voltage. A fault is set if the voltage is greater than a calibrated threshold.	CAN supply voltage	> 17 V	Ignition key	= On	0.09 [Sec]	Type B, 2 Trips
		This monitoring strategy checks if the motor relay is in an overvoltage situation. This protects the hydraulic pump against overvoltage. A fault is set if the supply voltage is above a calibrated threshold.	Voltage at motor relay	> 17 V	System voltage AND Ignition key	> 6.9 V  = On	1 [Sec]	Type B, 2 Trips
		DTC Pass	Turn ignition on and wait for at least 30sec without braking.					
System Voltage Low	P0562	This monitoring strategy checks if Ecu supply voltage is out of range low, which means below the HW (Hardware) switch off threshold but the HW is not switched off for the particular time. A fault is set if the Ecu supply voltage is below a threshold.	Ecu supply voltage	< 4.9 V	Ignition key	= On	0.2 [Sec]	Special Type C
		This monitoring strategy checks if the hydraulic components are in a hard undervoltage situation. A fault is set if the hydraulic supply voltage drops below a calibrated threshold.	Hydraulic supply voltage	< 6.9 V	Ignition key	= On	1 [Sec]	Special Type C
		This monitoring strategy checks the lower functional voltage range of the hydraulic components to ensure full system functionality. A fault is set if the valve voltage or the motor voltage drops below a calibrated threshold.	Valve relay voltage	< 9.4 V	Ignition key	= On	1 [Sec]	Special Type C
		This monitoring checks the system supply voltage. A fault is set if the voltage is less than a calibrated threshold.	CAN supply voltage	< 7.5 V	Ignition key	= On	0.09 [Sec]	Special Type C
		This monitoring strategy checks if there is an undervoltage of the ASIC internal Sigma Delta Modulator (SDM). This monitoring works through an ASIC which measures an undervoltage and indicates an insufficient supply voltage of sigma delta converter to the microcontroller with SPI (Serial Peripheral Interface) protocol. A fault is set if the SDM (Sigma Delta Modulator) supply voltage is below a calibrated threshold.	Sigma delta converter supply voltage	< 5.5 V	Ignition key	= On	0.01 [Sec]	Special Type C
		DTC Pass	Turn ignition on and wait for at least 30sec without braking.					

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Traction Control Front Isolation Solenoid Valve Circuit	C1590	This monitoring strategy checks if the Valve-Driver-ASIC (Application Specific Integrated Circuit) FreeWheeling component is defective. A fault is set if the valve driver freewheeling cannot be switched on or off or if the trigger state is incorrect.	Freewheeling of valve driver cannot be switched OR Trigger state not correct	= True  = True	Ignition key AND Resistor Measurement Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the valve actuation corresponds to the expected value. The basic valve monitoring is triggered by the coordinator via the control message. A fault is set if the valve actuation is different from the expected value for a calibrated period of time.	Valve actuation	≠ expected value	Ignition key AND Resistor Measurement Test	= On  = Off	0.03 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the current through a valve is too high or too low. A fault is set if the valve current is above a calibrated threshold_1 or below a calibrated threshold_2 for a calibrated number of failed tests.	(Current through the valve OR Current through the valve) AND Both for a number of failed tests	> 0.12 A  < 0.085 A  > 5	Ignition key AND Leakage Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks the voltage at the output Qx or at the gate to detect if the Valve-Driver-ASIC (Application Specific Integrated Circuit) output driver is not functioning correctly. All PWM (Pulse Width Modulation) signal positive edges are counted, and the low time duration is measured. The resulting value is read out via SPI (Serial Peripheral Interface). The high and low limits of the real PWM signal, which are set by the output driver, are calculated using the measured number of edges and the low time. The calculated high and low limits depend on the activation used. A fault is set if the current activation value is outside the calculated limits.	Measured actuation duty OR Measured actuation duty AND Both for a number of times	< Set Actuation Duty - 20%  > Set Actuation Duty + 20%  > 5	Ignition key AND Resistor Measurement Test AND Leakage Test AND Valve Activation Register Test AND Silent Valve Driver Test	= On  = Off  = Off  = Off	0.05 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the transistor gates are set properly. Qx is the command sent to the transistor gate which commands the valve motor. The Qx monitor compares the expected value of Qx (the calculated Qx-ON/OFF value which is dependent on the current set valve activation) with the actual value of Qx (Qx-ON/OFF from the valve-related SPI (Serial Peripheral Interface) register) in order to check for correct output driver functionality (gate on/off). A fault is set if the actual Qx value does not match the expected Qx value.	(Measured Gate On Actuation Duty OR Measured Gate Off Actuation Duty) AND For a number of failed tests	< 95 %  > 5 %  > 5	Ignition key AND Resistor Measurement Test AND Leakage Test AND Valve Activation Register Test AND Silent Valve Driver Test	= On  = Off  = Off  = Off	0.03 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the valve-related resistor value is out of range during the resistor measurement. This resistor value is calculated by taking the mean of the voltage through the resistor. A fault is set if the valve resistor value is too high or too low.	Comparison of calculated resistance and measured resistance OR Comparison of calculated resistance and measured resistance AND For a number of times	> 0.2 Of calculated resistance  < -0.2 Of calculated resistance  > 2	Ignition key AND Resistor Measurement Test	= On  = On	0.015 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if there is a short circuit between valves or a defective coil during the Valve-Driver-ASIC (Application Specific Integrated Circuit) internal failure such as OpenLoad, UnderCurrent, OverCurrent, OverTemp, PGndLost or DxLost) during the Valve-Driver-ASIC Silent Valve Driver Test (SVDT). A fault is set if the ASIC current or temperature is below a calibrated threshold_1 or above a calibrated threshold_2 for a calibrated number of failed tests. A fault is also set if the High Side Switch Line Loss is below a calibrated threshold.	(Current at ASIC OR Current at ASIC OR Temperature at ASIC OR Temperature at ASIC OR High Side Switch Line Loss) AND For a number of times	< 0.05 A  > 0.14 A  < 25 °C  > 140 °C  < 0.005 A  > 2	Ignition key AND Silent Valve Driver Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the internal valve-driver-ASIC (Application Specific Integrated Circuit) register matches the current actuation during the Valve Actuation Register Test (VART). A fault is set if the measured gate actuation duty during the test actuation exceeds a calibrated threshold.	Measured gate actuation during test actuation AND For a number of times	< 0.005 A  > 2	Ignition key AND Valve Activation Register Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks the drift effects in the hardware current controller. The current regulator inside the valve driver returns current feedback for each activated valve. A fault is set if the difference between an activated valve's measured activation (current regulator feedback) and activation calculated from the previous resistor measurement values (current pattern) is above a calibrated threshold.	Comparison of calculated current with measured current AND Comparison of calculated current with measured current	> 20 %  < -20 %	Ignition key AND Vehicle speed AND Previous successful resistor measurement AND Valve Drift Check	= On  > 9.32 mph  = True  = active	0.025 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec. Accelerate vehicle to at least 18.6 mph and hold the speed for at least 20s		d			
Traction Control Front Prime Solenoid Valve Circuit	C158F	This monitoring strategy checks if the Valve-Driver-ASIC (Application Specific Integrated Circuit) FreeWheeling component is defective. A fault is set if the valve driver freewheeling cannot be switched on or off or if the trigger state is incorrect.	Freewheeling of valve driver cannot be switched OR Trigger state not correct	= True  = True	Ignition key AND Resistor Measurement Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the valve actuation corresponds to the expected value. The basic valve monitoring is triggered by the coordinator via the control message. A fault is set if the valve actuation is different from the expected value for a calibrated period of time.	Valve actuation	≠ expected value	Ignition key AND Resistor Measurement Test	= On  = Off	0.03 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the current through a valve is too high or too low. A fault is set if the valve current is above a calibrated threshold_1 or below a calibrated threshold_2 for a calibrated number of failed tests.	(Current through the valve OR Current through the valve) AND Both for a number of failed tests	> 0.12 A  < 0.085 A  > 5	Ignition key AND Leakage Test	= On  = On	0.015 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks the voltage at the output Qx or at the gate to detect if the Valve-Driver-ASIC (Application Specific Integrated Circuit) output driver is not functioning correctly. All PWM (Pulse Width Modulation) signal positive edges are counted, and the low time duration is measured. The resulting value is read out via SPI (Serial Peripheral Interface). The high and low limits of the real PWM signal, which are set by the output driver, are calculated using the measured number of edges and the low time. The calculated high and low limits depend on the activation used. A fault is set if the current activation value is outside the calculated limits.	Measured actuation duty OR Measured actuation duty AND Both for a number of times	< Set Actuation Duty - 20%  > Set Actuation Duty + 20%  > 5	Ignition key AND Resistor Measurement Test AND Leakage Test AND Valve Activation Register Test AND Silent Valve Driver Test	= On  = Off  = Off  = Off	0.05 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the transistor gates are set properly. Qx is the command sent to the transistor gate which commands the valve motor. The Qx monitor compares the expected value of Qx (the calculated Qx-ON/OFF value which is dependent on the current set valve activation) with the actual value of Qx (Qx-ON/OFF from the valve-related SPI (Serial Peripheral Interface) register) in order to check for correct output driver functionality (gate on/off). A fault is set if the actual Qx value does not match the expected Qx value.	(Measured Gate On Actuation Duty OR Measured Gate Off Actuation Duty) AND For a number of failed tests	< 95 %  > 5 %  > 5	Ignition key AND Resistor Measurement Test AND Leakage Test AND Valve Activation Register Test AND Silent Valve Driver Test	= On  = Off  = Off  = Off	0.03 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the valve-related resistor value is out of range during the resistor measurement. This resistor value is calculated by taking the mean of the voltage through the resistor. A fault is set if the valve resistor value is too high or too low.	Comparison of calculated resistance and measured resistance OR Comparison of calculated resistance and measured resistance AND For a number of times	> 0.2 Of calculated resistance  < -0.2 Of calculated resistance  > 2	Ignition key AND Resistor Measurement Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if there is a short circuit between valves or a defective coil during the Valve-Driver-ASIC (Application Specific Integrated Circuit) internal failure such as OpenLoad, UnderCurrent, OverCurrent, OverTemp, PGndLost or DxLost) during the Valve-Driver-ASIC Silent Valve Driver Test (SVDT). A fault is set if the ASIC current or temperature is below a calibrated threshold_1 or above a calibrated threshold_2 for a calibrated number of failed tests. A fault is also set if the High Side Switch Line Loss is below a calibrated threshold.	(Current at ASIC OR Current at ASIC OR Temperature at ASIC OR Temperature at ASIC OR High Side Switch Line Loss) AND For a number of times	< 0.05 A  > 0.14 A  < 25 °C  > 140 °C  < 0.005 A  > 2	Ignition key AND Silent Valve Driver Test	= On  = On	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the internal valve-driver-ASIC (Application Specific Integrated Circuit) register matches the current actuation during the Valve Actuation Register Test (VART). ## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Valve Relay Circuit	C106D	This monitoring strategy checks if the valve relay is correctly activated by comparing the valve relay output voltage (UVR) to the supply voltage (UBVR). The valve relay is typically switched on or off during the Fail-Safe Logic Test (FSLT) to detect if the valve relay has not switched on successfully. A fault is set if the resulting ratio of UVR to UBVR is below a calibrated threshold.	Valve relay output voltage / Valve relay supply voltage	< 0.7	Ignition key AND Fail-Safe Logic Test	= On  = On	0.45 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the valve relay is correctly activated by comparing the valve relay output voltage (UVR) to the valve relay supply voltage (UBVR). A fault is set if the resulting ratio is below a calibrated threshold which indicates that the valve relay has not switched on successfully.	Valve relay output voltage / Valve relay supply voltage	< 0.7	Ignition key AND Fail-Safe Logic Test is finished AND Valve relay output voltage mid level supply	= On  = True  = On	0.025 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Valve Relay Circuit High	C1070	This monitoring strategy checks if the valve relay output voltage (UVR) voltage is shorted to the valve relay supply voltage (UBVR), if the valve relay is stuck, or if a missing valve relay watchdog is not detected. Two separate tests check if the valve relay can be switched off. The first test checks if a missing Built In Self Test (BIST) watchdog leads to a switched off valve relay because the hydraulic state "off". The second test checks if the valve-relay-safety-switch detects a missing valve-relay-watchdog, which must lead to a switched off valve relay. During checks, the Fail-Safe Logic Test (FSLT) derives the valve relay status by comparing the valve relay supply voltage to the valve relay voltage. A fault is set if test 1 or 2 detects that the valve relay is still switched on.	Missing BIST watchdog detected OR Valve relay safety switch detects a missing valve relay watchdog	= True  = True	Ignition key AND Initial Fail-Safe Logic Test is running	= On  = True	0.45 [Sec]	Type A, 1 Trip
		This monitoring checks if there is a short circuit to the valve relay. All hydraulic valves are supplied with power through one relay. This relay is checked for circuit continuity. A fault is set if the valve solenoid high side voltage is above a calibrated threshold, meaning a short circuit to the battery voltage is detected. The threshold depends on the system voltage.	Valve relay solenoid low side voltage	> 4.8 V	Ignition key AND Valve relay enabled AND System voltage	= On  = False  > 6.9 V	0.2 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Valve Relay Circuit Low	C106F	This monitoring strategy checks if a valve relay high ohmic short to ground has occurred by comparing the valve relay output voltage (UVR) to the valve relay supply voltage (UBVR). A fault is set if the resulting ratio is below a calibrated threshold which indicates that the valve relay is shorted to ground.	Valve relay output voltage / Valve relay supply voltage	< 0.3	Ignition key AND Valve relay supply voltage	= On  > 6.9 V	0.2 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if there is a valve relay short to ground by comparing the valve relay output voltage (UVR) to the valve relay supply voltage (UBVR). A fault is set if the resulting ratio is below a calibrated threshold which indicates that the valve relay is shorted to ground.	Valve relay output voltage / Valve relay supply voltage	< 0.10	Ignition key AND Valve relay supply voltage	= On  > 5 V	0.04 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Valve Relay Circuit Performance	C106E	This monitoring strategy checks if the supply voltage (UBVR) is too low during evaluation of failsafe logic. During an undervoltage situation, an evaluation of the valve relay safety switch test is not possible. A fault is set if the supply voltage (UBVR) is below a calibrated threshold for a calibrated period of time.	Valve relay supply line voltage For time	< 5 V > 0.5 Sec	Ignition key AND Fail-Safe Logic Test	= On  = On	0.5 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Vehicle Speed - Wheel Speed Correlation	P215A	This monitoring strategy checks if the ABS (Anti-lock Brake System) is correctly triggered. Normally, an ABS intervention should be applied for limited time. A fault is set if the system detects an ABS intervention for more than a calibrated period of time.	Anti-lock Brake System intervention for a period of time	> 60 Sec	System voltage AND Electronic Brake Control Unit state	> 6.9 V  = Started with hardware reset	60 [Sec]	Type A, 1 Trip
		This monitor checks the wheel speed sensor signals for not plausible or invalid signals. The failure is set if at least three Wheel Speed Sensor (WSS) failure suspicions are set (at the same time). These WSS failure suspicions are set by other wheel speed monitorings.	Wheel Speed Sensor failure suspicions set	> 2	System voltage AND Ignition key	> 6.9 V  = On	0.5 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if whether at one or at several wheels no impulse wheel or impulse wheels with wrong tooth-/multiple number or wheels with a different circumference are mounted. Additionally, signal-loss caused by too high airgap between sensor and impulse wheel is detected at least over time; if another plausibility monitoring was not successful. A fault is set if an individual wheel monitor detects a deviation above a calibrated threshold but is not able to identify the faulty wheel speed sensor.	Difference between maximum and minimum wheel speed for vehicle speed OR Difference between maximum and minimum wheel speed for vehicle speed	> 3.7 mph < 12.4 mph  > 6 % > 12.4 mph	Ignition key	= On	80 [Sec]	Type A, 1 Trip
		This monitoring checks for wheel speed sensor failures. A suspected wheel speed sensor failure is set if any of the following monitors set a suspected failure flag: noise monitor, slip monitor, dynamic monitor, absent signal monitor or flat tire monitor. If a wheel speed sensor failure has occurred, the Traction Control System (TCS) and the valve drift check are not available. A fault is set if more than one suspected wheel speed sensor failure occur simultaneously.	Number of suspected wheel speed sensor failures in the same time	= 2	Ignition key AND System voltage AND Ignition key	= On  > 6.9 V  = On	0.1 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC1 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring checks for wheel speed sensor failures. A suspected wheel speed sensor failure is set if any of the following monitors set a suspected failure flag: noise monitor, slip monitor, dynamic monitor, absent signal monitor or flat tire monitor. If a wheel speed sensor failure has occurred, the Traction Control System (TCS) and the valve drift check are not available. A fault is set if more than one suspected wheel speed sensor failure occur simultaneously for longer than a calibrated duration.	Number of suspected wheel speed sensor failures in the same time For time	= 2 > 0.5 Sec	Ignition key AND System voltage	= On  > 6.9 V	> 0.5 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the return pump is weak due to a heavy load. A fault is set if the calculated generator voltage is over a calibrated threshold and the measured generator voltage is below the same threshold.	Calculated generator voltage AND Measured generator voltage	> 0.6 V  < 0.6 V	System voltage AND pump motor AND Electronic Brake Control Unit state	> 6.9 V  = On  = Started with hardware reset	> 0.5 [Sec]	Type A, 1 Trip
		DTC Pass	Drive off and straight ahead with more than 37.2 mph for at least 40s.					
Wheel Speed Sensors Supply Circuit High	C05A3	This monitoring strategy detects wheel speed sensor supply line short to battery by monitoring reverse current.	Reverse current detected on WSS supply line for	> 3.5 Sec	Ignition key	= On	3.5 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 5sec.					
Wheel Speed Sensors Supply Circuit Low	C05A4	This monitoring strategy checks the for an undervoltage situation with the System ASIC internal hardware comparator. This comparator monitors the voltage between the wheel speed sensor (WSS) power supply line and WSS signal line. A fault is set if the voltage between the WSS power supply line and WSS signal line is under the threshold.	voltage between the WSS power supply line and WSS signal line	< 6.7 V	System voltage AND Wheel speed sensor test completed	> 6.9 V  = True	0.06 [Sec]	Type A, 1 Trip
		DTC Pass	Turn ignition on and wait for at least 30sec without braking.

## 16 OBDG02 DTC Description

DTC Description	BSC1 Disabling DTCs
C0500 Left Front Wheel Speed Sensor Circuit/Open	C0501 Left Front Wheel Speed Sensor Range/Performance
	C0502 Left Front Wheel Speed Sensor Circuit Low
	C0503 Left Front Wheel Speed Sensor Circuit High
	C0504 Left Front Wheel Speed Sensor Intermittent/Erratic
	C0555 Left Front Wheel Speed Sensor Incorrect Component Installed
	C05A4 Wheel Speed Sensors Supply Circuit Low
	P0562 System Voltage Low
	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	P215A Vehicle Speed - Wheel Speed Correlation
C0501 Left Front Wheel Speed Sensor Range/Performance	C0500 Left Front Wheel Speed Sensor Circuit/Open
	C0502 Left Front Wheel Speed Sensor Circuit Low
	C0503 Left Front Wheel Speed Sensor Circuit High
	C0504 Left Front Wheel Speed Sensor Intermittent/Erratic
	C0555 Left Front Wheel Speed Sensor Incorrect Component Installed
	C05A4 Wheel Speed Sensors Supply Circuit Low
	P0562 System Voltage Low
	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	P215A Vehicle Speed - Wheel Speed Correlation
C0502 Left Front Wheel Speed Sensor Circuit Low	C0500 Left Front Wheel Speed Sensor Circuit/Open
	C0501 Left Front Wheel Speed Sensor Range/Performance
	C0503 Left Front Wheel Speed Sensor Circuit High
	C0504 Left Front Wheel Speed Sensor Intermittent/Erratic
	C0555 Left Front Wheel Speed Sensor Incorrect Component Installed
	C05A4 Wheel Speed Sensors Supply Circuit Low
	P0562 System Voltage Low
	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	P215A Vehicle Speed - Wheel Speed Correlation
C0503 Left Front Wheel Speed Sensor Circuit High	C0500 Left Front Wheel Speed Sensor Circuit/Open
	C0501 Left Front Wheel Speed Sensor Range/Performance
	C0502 Left Front Wheel Speed Sensor Circuit Low
	C0504 Left Front Wheel Speed Sensor Intermittent/Erratic
	C0555 Left Front Wheel Speed Sensor Incorrect Component Installed

## 16 OBDG02 DTC Description

DTC Description	BSC1 Disabling DTCs
C0503 Left Front Wheel Speed Sensor Circuit High (continued)	C05A4 Wheel Speed Sensors Supply Circuit Low
	P0562 System Voltage Low
	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	P215A Vehicle Speed - Wheel Speed Correlation
C0504 Left Front Wheel Speed Sensor Intermittent/Erratic	C0500 Left Front Wheel Speed Sensor Circuit/Open
	C0501 Left Front Wheel Speed Sensor Range/Performance
	C0502 Left Front Wheel Speed Sensor Circuit Low
	C0503 Left Front Wheel Speed Sensor Circuit High
	C0555 Left Front Wheel Speed Sensor Incorrect Component Installed
	C05A4 Wheel Speed Sensors Supply Circuit Low
	P0562 System Voltage Low
	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	P215A Vehicle Speed - Wheel Speed Correlation
C0506 Right Front Wheel Speed Sensor Circuit/Open	C0507 Right Front Wheel Speed Sensor Range/Performance
	C0508 Right Front Wheel Speed Sensor Circuit Low
	C0509 Right Front Wheel Speed Sensor Circuit High
	C050A Right Front Wheel Speed Sensor Intermittent/Erratic
	C0556 Right Front Wheel Speed Sensor Incorrect Component Installed
	C05A4 Wheel Speed Sensors Supply Circuit Low
	P0562 System Voltage Low
	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	P215A Vehicle Speed - Wheel Speed Correlation
C0507 Right Front Wheel Speed Sensor Range/Performance	C0506 Right Front Wheel Speed Sensor Circuit/Open
	C0508 Right Front Wheel Speed Sensor Circuit Low
	C0509 Right Front Wheel Speed Sensor Circuit High
	C050A Right Front Wheel Speed Sensor Intermittent/Erratic
	C0556 Right Front Wheel Speed Sensor Incorrect Component Installed
	C05A4 Wheel Speed Sensors Supply Circuit Low
	P0562 System Voltage Low
	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)

## 16 OBDG02 DTC Description

DTC Description	BSC1 Disabling DTCs
C0507 Right Front Wheel Speed Sensor Range/Performance (continued)	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	P215A Vehicle Speed - Wheel Speed Correlation
C0508 Right Front Wheel Speed Sensor Circuit Low	C0506 Right Front Wheel Speed Sensor Circuit/Open
	C0507 Right Front Wheel Speed Sensor Range/Performance
	C0509 Right Front Wheel Speed Sensor Circuit High
	C050A Right Front Wheel Speed Sensor Intermittent/Erratic
	C0556 Right Front Wheel Speed Sensor Incorrect Component Installed
	C05A4 Wheel Speed Sensors Supply Circuit Low
	P0562 System Voltage Low
	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	P215A Vehicle Speed - Wheel Speed Correlation
	C0509 Right Front Wheel Speed Sensor Circuit High
C0507 Right Front Wheel Speed Sensor Range/Performance	
C0508 Right Front Wheel Speed Sensor Circuit Low	
C050A Right Front Wheel Speed Sensor Intermittent/Erratic	
C0556 Right Front Wheel Speed Sensor Incorrect Component Installed	
C05A4 Wheel Speed Sensors Supply Circuit Low	
P0562 System Voltage Low	
P0601 Control Module Read Only Memory (ROM)	
P0603 Control Module Long Term Memory Reset	
P0604 Control Module Random Access Memory (RAM)	
P0606 Control Module Internal Performance	
P060B Internal Control Module A/D Processing Performance	
P062F Control Module Long Term Memory Performance	
P215A Vehicle Speed - Wheel Speed Correlation	
C050A Right Front Wheel Speed Sensor Intermittent/Erratic	
	C0507 Right Front Wheel Speed Sensor Range/Performance
	C0508 Right Front Wheel Speed Sensor Circuit Low
	C0509 Right Front Wheel Speed Sensor Circuit High
	C0556 Right Front Wheel Speed Sensor Incorrect Component Installed
	C05A4 Wheel Speed Sensors Supply Circuit Low
	P0562 System Voltage Low
	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	P215A Vehicle Speed - Wheel Speed Correlation

## 16 OBDG02 DTC Description

DTC Description	BSC1 Disabling DTCs
C050C Left Rear Wheel Speed Sensor Circuit/Open	C050D Left Rear Wheel Speed Sensor Range/Performance
	C050E Left Rear Wheel Speed Sensor Circuit Low
	C050F Left Rear Wheel Speed Sensor Circuit High
	C0510 Left Rear Wheel Speed Sensor Intermittent/Erratic
	C0557 Left Rear Wheel Speed Sensor Incorrect Component Installed
	C05A4 Wheel Speed Sensors Supply Circuit Low
	P0562 System Voltage Low
	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	P215A Vehicle Speed - Wheel Speed Correlation
C050D Left Rear Wheel Speed Sensor Range/Performance	C050C Left Rear Wheel Speed Sensor Circuit/Open
	C050E Left Rear Wheel Speed Sensor Circuit Low
	C050F Left Rear Wheel Speed Sensor Circuit High
	C0510 Left Rear Wheel Speed Sensor Intermittent/Erratic
	C0557 Left Rear Wheel Speed Sensor Incorrect Component Installed
	C05A4 Wheel Speed Sensors Supply Circuit Low
	P0562 System Voltage Low
	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	P215A Vehicle Speed - Wheel Speed Correlation
C050E Left Rear Wheel Speed Sensor Circuit Low	C050C Left Rear Wheel Speed Sensor Circuit/Open
	C050D Left Rear Wheel Speed Sensor Range/Performance
	C050F Left Rear Wheel Speed Sensor Circuit High
	C0510 Left Rear Wheel Speed Sensor Intermittent/Erratic
	C0557 Left Rear Wheel Speed Sensor Incorrect Component Installed
	C05A4 Wheel Speed Sensors Supply Circuit Low
	P0562 System Voltage Low
	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	P215A Vehicle Speed - Wheel Speed Correlation
C050F Left Rear Wheel Speed Sensor Circuit High	C050C Left Rear Wheel Speed Sensor Circuit/Open
	C050D Left Rear Wheel Speed Sensor Range/Performance
	C050E Left Rear Wheel Speed Sensor Circuit Low
	C0510 Left Rear Wheel Speed Sensor Intermittent/Erratic
	C0557 Left Rear Wheel Speed Sensor Incorrect Component Installed

## 16 OBDG02 DTC Description

DTC Description	BSC1 Disabling DTCs
C050F Left Rear Wheel Speed Sensor Circuit High (continued)	C05A4 Wheel Speed Sensors Supply Circuit Low
	P0562 System Voltage Low
	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	P215A Vehicle Speed - Wheel Speed Correlation
C0510 Left Rear Wheel Speed Sensor Intermittent/Erratic	C050C Left Rear Wheel Speed Sensor Circuit/Open
	C050D Left Rear Wheel Speed Sensor Range/Performance
	C050E Left Rear Wheel Speed Sensor Circuit Low
	C050F Left Rear Wheel Speed Sensor Circuit High
	C0557 Left Rear Wheel Speed Sensor Incorrect Component Installed
	C05A4 Wheel Speed Sensors Supply Circuit Low
	P0562 System Voltage Low
	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	P215A Vehicle Speed - Wheel Speed Correlation
C0512 Right Rear Wheel Speed Sensor Circuit/Open	C0513 Right Rear Wheel Speed Sensor Range/Performance
	C0514 Right Rear Wheel Speed Sensor Circuit Low
	C0515 Right Rear Wheel Speed Sensor Circuit High
	C0516 Right Rear Wheel Speed Sensor Intermittent/Erratic
	C0558 Right Rear Wheel Speed Sensor Incorrect Component Installed
	C05A4 Wheel Speed Sensors Supply Circuit Low
	P0562 System Voltage Low
	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance

## 16 OBDG02 DTC Description

DTC Description		BSC1 Disabling DTCs	
U179D	Lost Communication with Brake System Control Module B on Chassis Expansion Bus (continued)	P060B	Internal Control Module A/D Processing Performance
		P062F	Control Module Long Term Memory Performance
		U0077	Control Module Communication Chassis Expansion CAN Bus Off - Generic
U18B5	Lost Communication with Hybrid Powertrain Control Module on Chassis Expansion CAN Bus	C1287	Regenerative Braking Axle Torque Achieved Message Counter Incorrect
		P0562	System Voltage Low
		P0563	System Voltage High
		P0601	Control Module Read Only Memory (ROM)
		P0603	Control Module Long Term Memory Reset
		P0604	Control Module Random Access Memory (RAM)
		P0606	Control Module Internal Performance
		P060B	Internal Control Module A/D Processing Performance
		P062F	Control Module Long Term Memory Performance
		U0077	Control Module Communication Chassis Expansion CAN Bus Off - Generic

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Brake Booster Internal Power Driver Range/Performance	C0595	This monitoring strategy checks the ability of the Booster Master Switch to be switched correctly. This is done by checking in 3 steps: a) The booster master switch is switched on. After a defined period the test checks if the booster master switch is switched on by evaluating the ratio of Voltage Sensor 2 and Voltage Sensor 1	Voltage Sensor2 / Voltage Sensor1	< 0.88	Software State	= Init	0.015 [Sec]	Type A, 1 Trip
		b) The Booster Master Switch is switched off. After a defined period the Voltage Sensor 2 value is evaluated.	Voltage Sensor2	> 0.88 V	Software State	= Init	0.015 [Sec]	Type A, 1 Trip
		c) The booster master switch is switched on again. After a defined period the test checks if the booster master switch is switched on by evaluating the ratio of Voltage Sensor 2 and Voltage Sensor 1	Voltage Sensor2 / Voltage Sensor1	< 0.88	Software State	= Init	0.015 [Sec]	Type A, 1 Trip
		DTC PASS	Turn ignition on and wait for at least 5sec					
Brake Booster Motor "A" Current Sensor Circuit Range/Performance	C0596	This monitoring strategy checks the functionality of the over current detection system by switching the comparator off and on. This is done by setting the pulse width modulated signal to the minimum or maximum pulse ratio. The proper comparator switching is verified by reading back the comparator's output via a feedback line. A fault is set - if the comparator's output does not indicate the correct switch position for the current pulse ratio. - if the voltage at the Booster Master Switch UB6 is not close to zero or to the power supply battery voltage (UBB), depending on the current pulse ratio.	PWM ratio VoltageSensor 2/ VoltageSensor 1 PWM ratio VoltageSensor 2	= maximum < 0.88 = minimum > 0.88 V	Software State BMS control BMS control	= Init = switched on = switched off	0.03 [Sec]	Type A, 1 Trip
		This monitoring strategy checks for over current at the electric motor driver. Current through the motor driver is monitored by hardware and the feedback pin reports if over current has been detected. A fault is set if the feedback pin is at a high level.	Feedback pin level	logical high	Software State	=Init OR Running OR Shutdown	0.03 [Sec]	Type A, 1 Trip
		DTC PASS	Turn ignition on and wait for at least 5sec					

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Brake Booster Motor "A" Performance	C0594	This monitoring strategy checks if the movement of electric motor is in proper direction. This is done by: a) Checking if the sign of the target speed matches that of the actual speed. b) Checking the changes in direction of the measured electric motor speed within a period. A counter is incremented each time a change in direction is detected.	Absolute(actual electric motor speed) Or Counter	'< 15 rad/Sec  > 7	Software State  Absolute(target electric motor speed)  Absolute(target electric motor speed )- Absolute(actual electric motor speed)	= Running OR Shutdown  > 25 rad/Sec  > 15 rad/Sec	0.15 [Sec]	Type A, 1 Trip
		This monitoring strategy checks the oscillation of the ibooster motor.A fault is set if if the sign of the actual motor speed has changed to often within a short time interval and no change of the sign of the desired speed.	sign of the actual motor speed has changed AND Sign of the desired speed has change	= True  = False	Software State AND Brake Light Switch	= Running OR Shutdown  = On	0.15 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if there is an unintended backward rotation of the ESC electric motor. The speed controller monitor detects an unintended backward rotation of the brake booster electric motor. A fault is set if the speed deviation is greater than a threshold.	target electric motor speed - Absolute(actual electric motor speed)	> 40 rad/Sec	Software State target electric motor speed actual electric motor speed	= Running OR Shutdown > 0 rpm ≤ 1 rpm	0.015 [Sec]	Type A, 1 Trip
		DTC PASS	Apply the brake pedal for about 50% for at least 1 sec and then release the brake pedal.					
Brake Booster Motor "A" Phase U-V-W Circuit Low	C0580	This monitoring strategy checks if the gate supply voltage of the electric motor bridge driver is too low. A gate under voltage protection circuit as a part of electric motor driver circuit compares the gate supply voltage of the bridge driver with the power supply of the electric motor. A fault is set if the gate supply voltage is too low compared to the power supply of the electric motor.	Voltage Sensor 2 – Gate supply voltage	> 7 V	Software State	= Running OR Shutdown	0.005 [Sec]	Type A, 1 Trip
			DTC PASS	Turn ignition on and wait for at least 5sec				
Brake Booster Motor "A" Phase U-V-W Circuit Range/Performance	C0582	This monitoring strategy checks if two or more gate transistors out of six of the B6-bridge are shorted to each other. One high-side transistor and one low-side transistor of different electric motor phases are switched on simultaneously (all 6 combinations will be switched once within one test execution). If two gates are shorted, one transistor switches on unintentionally, leading to a very high current. A fault is set if the current exceeds a threshold.	Current	> 150 A	Software State	= Running OR Shutdown	0.004 [Sec]	Type A, 1 Trip
			DTC PASS	Turn ignition on and wait for at least 5sec				
Brake Booster Motor "A" Phase U-V-W Circuit/Open	C057F	This monitoring strategy checks if MOS-FETs of electric motor driver can be controlled and actuate properly. This monitoring strategy checks if MOS-FETs of electric motor driver can be controlled and actuate properly. A fault is set if a low-side transistor is switched on and the PhaseW voltage is in range. Similarly A fault is set if a high-side transistor is switched on and the PhaseW voltage is in range.	low-side transistor PhaseW voltage / Voltage Sensor 2 OR high-side transistor PhaseW voltage / Voltage Sensor 2	switched on ≥ 0.463  switched on ≤ 0.483	Software State electric motor	= Running OR Shutdown = not controlled	0.005 [Sec]	Type A, 1 Trip
			DTC PASS	Turn ignition on and wait for at least 5sec				

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Brake Booster Motor "A" Phase U-V-W Current High	C0590	This monitoring strategy checks if there is a positive leakage current at the electric motor driver circuit during control. Leakage current at motor driver is monitored during inactivity of half bridge. A fault is set if the leakage current is above a threshold.	Current Sensor	> 20 A	Software State electric motor	= Running OR Shutdown = controlled	0.005 [Sec]	Type A, 1 Trip
		DTC PASS	Apply the brake pedal for about 50% for at least 1 sec and then release the brake pedal.					
Brake Booster Motor "A" Phase U-V-W Current Low	C0591	This monitoring strategy checks if the leakage current at the motor is in range low. Leakage current at motor driver is monitored during inactivity of half bridge. A fault is set if the leakage current is below a threshold.	Current Sensor	< -20 A	Software State electric motor	= Running OR Shutdown = controlled	0.005 [Sec]	Type A, 1 Trip
		DTC PASS	Apply the brake pedal for about 50% for at least 1 sec and then release the brake pedal.					
Brake Booster Motor "A" Position Sensor Circuit Range/Performance	C058A	This monitoring strategy checks if the RPS1 has a gradient failure. The Electric Motor Speed is equivalent to the gradient of the rotor rotation. A fault is set if the RPS 1 gradient exceeds a threshold.	Absolute(RPS1 gradient)	> 73 °/mSec	Software State	= Running OR Shutdown	0.005 [Sec]	Type A, 1 Trip
		This monitoring strategy checks the rationality of the measured electric motor backward stop position. At end of line, the electric motor backward stop position is stored at EEPROM. This monitor compares the measured electric motor backward stop position with the stored electric motor backward stop position. If there electric motor rotates more than a threshold value to move to backward stop position, a mechanical defect should be present. A negative deviation of expected rotation will be detected by PreDriveCheck monitor. A fault is set if the difference between the measured electric motor backward stop position and the stored electric motor backward stop position exceeds a threshold.	Absolute(measured electric motor backward stop position - stored electric motor backward stop position)	> 60 °	Software State	= Running OR Shutdown	0.005 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		<p>This monitoring strategy checks for proper eBoost actuator functionality.</p> <p>(a) A command is sent to move the boost body to the backward bound position (housing).</p> <p>(b) Once the backward bound position is reached (when the boost body comes in contact with the housing), a command is sent to move the boost body forwards to the idle position.</p> <p>A fault is set if</p> <p>(a) :</p> <ul style="list-style-type: none"> <li>- the backward position is not reached within a calibrated time, depending of last post drive check.</li> <li>- the electric motor is rotating in the wrong direction with a speed exceeding a threshold.</li> </ul> <p>(b):</p> <ul style="list-style-type: none"> <li>- the idle position is not reached within a calibrated time</li> </ul>	<p>Absolute(electric motor speed) electric motor moving direction OR backward bound position OR idle position</p>	<p>&gt; 20 rad/s opposite than controlled</p> <p>not reached</p> <p>not reached</p>	Software State	= Init	3 [sec]	Type A, 1 Trip
		<p>This monitoring strategy checks the rationality of RPS1. The rotor angle is calculated internally in RPS1 IC using the raw values of the X and Y direction of the magnetic field orientation after they are internally corrected (e.g. due to off-center positioning of the sensor chip in the magnetic field).</p> <p>This internal calculation is monitored by an redundant recalculation in eBoost ECU using the transmitted X and Y raw values and correction values delivered by the rotor position sensor 1 IC. Both rotor angles, the RPS1 delivered one and the eBoost calculated one, are compared. A fault is set if the deviation between the recalculated angle and the RPS 1 angle delivered by the rotor position Sensor 1 IC exceeds a threshold.</p>	<p>Absolute(measured RPS1 angle - recalculated angle)</p>	> 7.8 °	Software State	= Running OR Shutdown	0.05 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		<p>This monitoring strategy checks if vector length of RPS vector does not exceed an upper threshold. A permanent magnet is located at the end of the electric motor shaft. The RPS uses the Giant Magneto Resistance (GMR) principle to measure the X and Y direction of the magnetic field. The rotor position is calculated using these raw values after they are internally corrected (e.g due to off-center positioning of the sensor chip in the magnetic field).</p> <p>At a given temperature, the vector length <math>\sqrt{(X^2 + Y^2)}</math> should be constant due to the defined magnetic field. Hence within the calibrated temperature range of -50°C to 150°C the vector length must lie within a defined range. A fault will be set if the calculated vector length is above a threshold.</p>	Calculated vector length	> 20000 digits	Software State	= Running OR Shutdown	0.05 [Sec]	Type A, 1 Trip
		<p>This monitoring strategy checks if the vector length value from the Rotor Position Sensor (RPS) is in range low. A permanent magnet is located at the end of the brake booster motor shaft. The Rotor Position Sensor (RPS) uses the Giant Magneto Resistance (GMR) principle to measure the X and Y direction of the magnetic field. The rotor position is calculated using these raw values after they are internally corrected (e.g due to off-center positioning of the sensor chip in the magnetic field).</p> <p>At a given temperature, the vector length <math>\sqrt{(X^2 + Y^2)}</math> should be constant due to the defined magnetic field. Hence within the calibrated temperature range of -50°C to 150°C the vector length must lie within a defined range. A fault will be set if the calculated vector length is below a threshold.</p>	Calculated vector length	< 3922 digits	Software State	= Running OR Shutdown	0.05 [Sec]	Type A, 1 Trip
		<p>This monitoring strategy checks if there is a noise in the RPS1 vector length. By design, the vector length <math>\sqrt{(X^2 + Y^2)}</math> is almost constant, but noise or failures on the X, Y or correction values might lead to an oscillation of the vector length. A high pass filter cuts unwanted high frequencies and noise. A fault will be set if the peak amplitude of the oscillation or noise of the RPS1 vector length is greater than a threshold.</p>	Absolute(Noise amplitude)	> 190 digits	Software State	= Running OR Shutdown	0.05 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		DTC PASS	Turn ignition on and wait for at least 5sec					
Brake Booster Rotor Position Sensor Configuration Error	C1277	This monitoring strategy checks if the rotor position sensor IC configuration EEPROM cell is valid. The configuration EEPROM cells of the Rotor Position Sensor (RPS) integrated circuit are monitored to ensure that the original configuration does not change. A fault is set if at least one monitored bit in the rotor position sensor IC configuration EEPROM cells differs from expected value.	Bit value	≠ expected bit value	Software State	= Running OR Shutdown	0.02 [Sec]	Type A, 1 Trip
		DTC PASS	Turn ignition on and wait for at least 5sec					
Brake Booster Rotor Position Sensor Message Counter Incorrect	C1276	This monitoring strategy checks if all RPS (Rotor Position Sensor) data are periodically updated. For the raw values, the correction values and the rotor angle, an update-flag within the RPS safety word exists which shows if all these values are periodically updated, not updated or still in the init-state. A fault will be set if the update-flag within the RPS safety word is either "not updated" or "init".	update-flag of RPS safety word OR update-flag of RPS safety word	= NOT_UPDATED  = INIT	Software State	= Running OR Shutdown	0.1 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the RPS1 internal clock works properly. The life counter monitoring detects if the internal IC clock is running with the desired frequency. At each clock cycle a counter is incremented in register cell. Between two monitoring tasks, the counter is incremented in a range corresponding to the ratio of clock-frequency to monitoring-frequency. A fault will be set if the counter increment is outside the range.	Counter increment OR Counter increment	< 6  > 24	Software State	= Running OR Shutdown	0.015 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if The Cyclic Redundancy Check (CRC) is correct. A CRC is sent from the Rotor Position Sensor (RPS) IC to the eBoost ECU for all data which is checked by eBoost. A fault is set if the recalculated CRC does not match the received one.	calculated checksum	≠ received checksum	Software State	= Running OR Shutdown	0.005 [Sec]	Type A, 1 Trip
		DTC PASS	Turn ignition on and wait for at least 5sec					
Brake Booster Rotor Position Sensor Unexpected Reset	C1275	This monitoring strategy checks if there was an unexpected reset at RPS. According to the specification of the Rotor Position Sensor (RPS) chip, the sensor can perform a reset under specific conditions (e.g. under voltage). If a reset happens, the position of the electric motor cannot be calculated anymore. The Hardware Related Software (HSW) checks if a reset of the sensor has happened by monitoring the reset-flag in EEPROM cell. A fault is set if the reset flag is set.	Reset-flag	= 1	Software State	= Running OR Shutdown	immediately	Type A, 1 Trip

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		DTC PASS	Turn ignition on and wait for at least 5sec					
Brake Pedal Position Sensor "A" Circuit High	P057D	This monitoring strategy checks if there is a circuit high at BPTS A. The brake pedal travel sensor signal A line monitor detects a short circuit to the supply voltage when no level change is detected for a period and logical signal level is high. A fault is set if there is a circuit high at BPTS A.	BPTS A signal line voltage AND rising or falling edge of BPTS A PWM	> 4.7 V  = not detected	Software State	= Running OR Shutdown	0.03 [Sec]	Type A, 1 Trip
		DTC PASS	Turn ignition on and wait for at least 5sec					
Brake Pedal Position Sensor "A" Circuit Intermittent/Erratic	P057E	This monitoring strategy checks if there is a BPTS A gradient error. This monitoring is detecting the gradient only in backward direction. There is no definition possible, how quick a driver can push the brake pedal. Negative gradient monitoring is used to prevent mechanical defects. A fault is set if the gradient of signal A is out of range.	BPTS A gradient	< -2000 mm/Sec	Software State	= Running OR Shutdown	0.005 [Sec]	Type A, 1 Trip
		DTC PASS	Turn ignition on and wait for at least 5sec					
Brake Pedal Position Sensor "A" Circuit Low	P057C	This monitoring strategy checks if there is a circuit low at BPTS A. The brake pedal travel sensor signal A line monitor detects a short circuit to ground when no level change is detected for a period and logical signal level is low. A fault is set if there is a circuit low at BPTS A.	BPTS A signal line rising or falling edge of BPTS A PWM	< 0.3 V  = not detected	Software State	= Running OR Shutdown	0.03 [Sec]	Type A, 1 Trip
		DTC PASS	Turn ignition on and wait for at least 5sec					
Brake Pedal Position Sensor "A" Circuit Range/Performance	P057B	This monitoring strategy checks if BPTS A is out of range high. A fault is set if the BPTS A is above a threshold.	BPTS A	> 47 mm	Software State	= Running OR Shutdown	0.04 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if BPTS A is out of range low. A fault is set if the BPTS A is above a threshold.	BPTS A	< -0.5 mm	Software State	= Running OR Shutdown	0.04 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if there is a BPTS A communication fault. The brake pedal travel sensor module is working with a frequency of 1 kHz. This is done by checking if - the frequency of the Pulse Width Modulated signal is in range. - the duty cycle of the Pulse Width Modulated brake of pedal position sensor A is in range. A fault is set if - the frequency is out of range. - the duty cycle of BPTS A is out of range.	BPTS A PWM frequency OR BPTS A PWM frequency OR BPTS A PWM duty cycle OR BPTS A PWM duty cycle	< 879.3 1/Sec  > 1127.17 1/Sec  < 7.32 %  > 92.83 %	Software State	= Running OR Shutdown	0.1 [Sec]	Type A, 1 Trip
		DTC PASS	Turn ignition on and wait for at least 5sec					

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Brake Pedal Position Sensor "A"/"B" Correlation	P05E0	This monitoring strategy checks if there is a deviation between the two sensor channels. A fault is set if the absolute value of the difference between both signals exceeds a threshold.	Absolute(BPTS A - BPTS B) OR Absolute(BPTS A - BPTS B)	> 1 mm  > 0.5 mm	BPTS A signal AND BPTS B signal OR BPTS A signal AND BPTS B signal	> 42 mm  > 42 mm  ≤ 42 mm  ≤ 42 mm	0.5 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if zero position of brake pedal is in range. The brake pedal travel sensor provides two separate signals with different transmissions and signal conditionings. This monitor checks if the arithmetic mean of BPTS A and BPTS B when brake pedal is not applied is within a tolerated range. A fault is set if the arithmetic mean of BPTS A and BPTS B is above a threshold.	(BPTS A + BPTS B) / 2 (BPTS A + BPTS B) / 2	> 0.6 mm < 1.5 mm	Software State	= Running OR Shutdown	0.5 [Sec]	Type A, 1 Trip
		DTC PASS	Turn ignition on and wait at least 60 sec with released brake pedal while the brake system and fluid has a temperature of approximately 20C					
Brake Pedal Position Sensor "B" Circuit High	P05DE	This monitoring strategy checks if there is a circuit high at BPTS B. The brake pedal travel sensor signal B line monitor detects a short circuit to the supply voltage when no level change is detected for a period and logical signal level is high. A fault is set if there is a circuit high at BPTS B.	BPTS B signal line rising or falling edge of BPTS B PWM	> 4.7 V = not detected	Software State	= Running OR Shutdown	0.03 [Sec]	Type A, 1 Trip
		DTC PASS	Turn ignition on and wait for at least 5sec					
Brake Pedal Position Sensor "B" Circuit Intermittent/Erratic	P05DF	This monitoring strategy checks if there is a BPTS B gradient error. This monitoring is detecting the gradient only in backward direction. There is no definition possible, how quick a driver can push the brake pedal. Negative gradient monitoring is used to prevent mechanical defects. A fault is set if the gradient of BPTS B is above a threshold.	BPTS B gradient	< -2000 mm/Sec	Software State	= Running OR Shutdown	0.005 [Sec]	Type A, 1 Trip
		DTC PASS	Turn ignition on and wait for at least 5sec					
Brake Pedal Position Sensor "B" Circuit Low	P05DD	This monitoring strategy checks if there is a circuit low at BPTS B. The brake pedal travel sensor signal B line monitor detects a short circuit to ground when no level change is detected for a period and logical signal level is low. A fault is set if there is a circuit low at BPTS B.	BPTS B signal line rising or falling edge of BPTS B PWM	< 0.3 V = not detected	Software State	= Running OR Shutdown	0.03 [Sec]	Type A, 1 Trip
		DTC PASS	Turn ignition on and wait for at least 5sec					
Brake Pedal Position Sensor "B" Circuit Range/Performance	P05DC	This monitoring strategy checks if BPTS B is out of range high. A fault is set if the BPTS B is above a threshold.	BPTS B	> 47 mm	Software State	= Running OR Shutdown	0.04 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if BPTS B is out of range low. A fault is set if the BPTS B is above a threshold.	BPTS B	< -0.5 mm	Software State	= Running OR Shutdown	0.04 [Sec]	Type A, 1 Trip

		This monitoring strategy checks if the message checksum is correct. The network driver sends and receives all network messages. It also checks if the messages are correct (length, checksum, alive-counter, reception timeout). With each newly sent message a checksum is calculated within the sending ECU. The value of the checksum is enclosed within the message. The receiving control unit calculates the checksum again and compares it with the sent one. A fault is set if the received checksum is different from the calculated checksum.	Checksum of 0x21E on Bus E not correct	= True	System voltage AND System voltage AND Bus Off Fault Active ECU is sending/receiving on CAN AND ECU Power Mode transition diagnostic enable delay timer	> 7.5 V  < 16 V  = False = True  ≥ 5 Sec	0.2 [Sec]	Type A, 1 Trip
Control Module Communication Chassis Expansion CAN Bus Off - Generic	U0077	The CAN (Control Area Network) bus E state is monitored periodically. A fault is set if the bus is in "Bus Off" state.	CAN bus E state	= Bus off	System voltage AND System voltage ECU is sending/receiving on CAN AND ECU Power Mode transition diagnostic enable delay timer	> 7.5 V  < 16 V = True  ≥ 5 Sec	0.09 [Sec]	Type A, 1 Trip
		This monitoring checks if the CAN initialization function has taken too long to finish . The access to message Ram by the CAN-Core is handle through a message interface register. In each cycle a CAN register bit is checked to determine if the bit is set. A fault is set if the loop lasts longer than a threshold	Number of CAN cycles	> 1000	Software State	= Init	0.01 [sec]	Type A, 1 Trip
Control Module Communication High Speed CAN Bus Off - Generic	U0073	The CAN (Control Area Network) bus A state is monitored periodically. A fault is set if the bus is in "Bus Off" state.	CAN bus A state	= Bus off	System voltage AND System voltage ECU is sending/receiving on CAN AND ECU Power Mode transition diagnostic enable delay timer	> 7.5 V  < 16 V = True  ≥ 5 Sec	0.24 [Sec]	Type B, 2 Trips

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring checks if the CAN initialization function has taken too long to finish . The access to message Ram by the CAN-Core is handle through a message interface register. In each cycle a CAN register bit is checked to determine if the bit is set. A fault is set if the loop lasts longer than a threshold	Number of CAN cycles	> 1000	Software State	= Init	0.01 [sec]	Type B, 2 Trips
Control Module Input Power "A" Circuit High	U3502	This monitoring checks the system supply voltage. A fault is set if the voltage is greater than a calibrated threshold.	CAN supply voltage	> 16 V	Software State	= Running	0.09 [Sec]	Type B, 2 Trips
		DTC PASS	Turn ignition on and wait for at least 30sec					
Control Module Input Power "A" Circuit Low	U3501	This monitoring strategy checks if voltage sensor 3 is out of range low, which means below the HW (Hardware) switch off threshold but the HW is not switched off for the particular time. A fault is set if the voltage sensor 3 is below a threshold	Ecu supply voltage	< 4.9 V	Software State	= Running	0.2 [Sec]	Special Type C
		This monitoring checks the system supply voltage. A fault is set if the voltage is less than a calibrated threshold.	CAN supply voltage	< 7.5 V	Software State	= Running	0.09 [Sec]	Special Type C
		DTC PASS	Turn ignition on and wait for at least 30sec					
Control Module Input Power "B" Circuit/Open	U3007	A fault is set if the Voltage Sensor 1 voltage drops below a threshold.	Voltage Sensor 1	< 2 V	Software State	= Running OR Shutdown	0.1 [Sec]	Type A, 1 Trip
		DTC PASS	Turn ignition on and wait for at least 5sec					
Control Module Input Power "B" Circuit High	U3506	This monitoring strategy checks the power supply battery (UBB) voltage. A fault is set If the UBB detection voltage is above the voltage limit for an extended period of time.	UBB AND Period of time	> 17 V  = 90 Sec	Software State	= Running OR Shutdown	90 [Sec]	Type B, 2 Trips
		This monitoring strategy checks the range of the supply voltage of the complex device driver module. A fault is set if this voltage is above a calibrated threshold.	Complex device motor voltage	> 18 V	Software State	= Running OR Shutdown	1.1 [Sec]	Type B, 2 Trips
		This monitoring strategy checks the power supply battery (UBB) voltage. A fault is set if the performance is reduced due to a voltage UBB above the level 1.	UBB AND Period of time	> 16.5 V  = 1.1 Sec	Software State	= Running OR Shutdown	1.1 [Sec]	Type B, 2 Trips
		DTC PASS	Turn ignition on and wait for at least 90sec					

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Control Module Input Power "B" Circuit Low	U3505	This monitoring strategy checks if Voltage Sensor 1 is out of range low. A fault is set if the voltage sensor 1 is below a threshold.	Voltage Sensor 1	< 6 V	Software State	= Running OR Shutdown	30 [Sec]	Special Type C
		This monitoring strategy checks the power supply battery (UBB) voltage. A fault is set if the UBB detection voltage is below the voltage limit for an extended period of time.	UBB AND Period of time	< 9.3 V  = 90 Sec	Software State	= Running OR Shutdown	90 [Sec]	Special Type C
		This monitoring strategy checks the range of the supply voltage of the complex device driver module. A fault is set if the voltage is less than a threshold.	Complex device motor voltage	< 6 V	Software State	= Running OR Shutdown	0.2 [Sec]	Special Type C
		This monitoring strategy checks the power supply battery (UBB) voltage. A fault is set if the system performance is reduced due to low voltage under level 1.	UBB	< 9.3 V	Software State	= Running OR Shutdown	0.2 [Sec]	Special Type C
		This monitoring strategy checks the power supply battery (UBB) voltage. A fault is set if the system performance is reduced due to low voltage under level 2.	UBB	< 7.5 V	Software State	= Running OR Shutdown	0.2 [Sec]	Special Type C
		DTC PASS	Turn ignition on and wait for at least 90sec					
Control Module Input Power "C" Circuit High	U350A	This monitoring strategy checks if Voltage Sensor 2 is out of range high. A fault is set if the Voltage Sensor 2 is above a threshold.	Voltage Sensor 2	> 19.8 V	Software State AND vehicle speed	= Running OR Shutdown  > 4 mph	90 [Sec]	Type A, 1 Trip
		DTC PASS	Drive straight ahead for at least 3.1 mile					
Control Module Input Power "C" Circuit Low	U3509	This monitoring strategy checks if Voltage Sensor 2 is out of range low. A fault is set if the Voltage Sensor 2 is below a threshold.	Voltage Sensor 2	< 6 V	Software State AND vehicle speed	= Running OR Shutdown  > 4 mph	90 [Sec]	Type A, 1 Trip
		DTC PASS	Drive straight ahead for at least 3.1 mile					
Control Module Input Power Circuit "A/B" Correlation	U3018	This monitoring checks if the battery power supply (UBB) is not too low compared to the ECU power supply to ensure a reliable switching of the Booster Master Switch. A fault is set if the difference between UBB and UB_ECU is higher than a threshold	UBB - UB_ECU	> 7 V	Software State	= Init OR Running OR Shutdown	0.01 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if the battery can provide enough power to the system. The central coordinator component in Electric Brake Booster Control Module is used to coordinate some initial tests and specific cyclic Electric Brake Booster Control Module Monitoring which depends on each other. A prerequisite for all initial tests except for the failsafe logic handler test is a sufficient Electric Brake Booster Control Module Power Supply Battery UBB. If the voltage is too low, the coordinator tests are delayed. During initial phase, all tests must be done once. If the initial phase takes too long, an undervoltage situation is given. A fault is set if any tests are initially delayed.	UBB OR [ UBB_ECU AND UBB-UBB_ECU ] OR [ UBB_ECU AND UBB-UBB_ECU ]	< 6 V  > 8.5 V  > 3.5 V  ≤ 8.5 V  > 1.5 V	Software state	= Init	0.5 [sec]	Type A, 1 Trip
		DTC PASS	Turn ignition on and wait for at least 5sec					
Control Module Input Power Circuit "B/C" Correlation	U3019	This monitoring strategy checks Voltage divider drift between the booster circuit supply line (Voltage Sensor 1) and the Motor Driver supply line (Voltage Sensor 2). A fault is set if the ratio of Voltage Sensor 1 and Voltage Sensor 2 is outside a range.	Voltage Sensor 2/Voltage Sensor 1 OR Voltage Sensor 2/Voltage Sensor 1	> 1.321  < 0.766	Software State	= Running OR Shutdown	2 [Sec]	Type A, 1 Trip
		DTC PASS	Turn ignition on and wait for at least 5sec					
Control Module Internal Performance	P0606	This monitoring strategy checks the proper functionality of the CPU Compare Module. The software is executed on 2 CPU cores simultaneously instruction by instruction (lock step mode). The output of both cores is compared by the CPU Compare Module. A self test runs at Init to verify that the CPU Compare Module is working properly. A fault will be set if the selftest failed.	Core Compare Module selftest	= failed	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks if there is a CPU exception. A fault is set if a data abort, a prefetch abort, or an undefined instruction occurs.	Data abort occurs OR Prefetch abort occurs OR Undefined instruction occurs	= True  = True  = True	Software State	= Init OR Running OR Shutdown	immediately	Type A, 1 Trip
		This monitoring strategy checks if the execution of a sensitive process task jitters too much. A fault is set if the real process execution time is greater than its ideal start time increased by a percentage.	The execution time of the internal system process task (ibooster systems)	> Ideal Time + 10% s	Software State	= Init OR Running OR Shutdown	immediately	Type A, 1 Trip
		This monitoring strategy checks if the reference voltage of A/D-converter is out of range. A fault is set if the bandgap voltage of the ADC is outside the allowable range.	Analog Digital Converter bandgap voltage OR Analog Digital Converter bandgap voltage	< 1145 V  > 1345 V	Software State	= Init OR Running OR Shutdown	immediately	Type A, 1 Trip

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy tests whether the system chip detects a missing watchdog trigger. At Initialization, the safety controller switches off the BMS. At switched off the BMS, a watchdog trigger is expected. If this trigger is missed, A fault is set. A fault is set if BMS switched off does not set a watchdog trigger.	Watchdog trigger AND BMS gate	missed  not switched off	Software State	= Init	1 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the motor driver circuit is able to be switched off and on. The electric motor driver switching (on/off) is tested by the microcontroller and the safety controllers to detect any short-circuit or interruption of the enable signal line. A fault is set if the electric motor driver is not properly switched off and on.	( Command sent : AND Motor Driver ) OR ( Command sent : AND Motor Driver )	switch off  enabled  switch on  disabled	Software State	= Init	1 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the error pin event counter is in range. The monitor pulls the error pin to test the event counter within the system chip. To prevent an electrical shutdown (which would disturb communication) during the provoked error pin event, the electrical decouple bit is set. A fault is set if the error pin event counter does not increment, or if the decouple bit is not reset.	Error pin event counter not incremented	= True	Software State	= Running	1 [sec]	Type A, 1 Trip
		This monitoring strategy checks if there is a High End Timer (HET) exception. A fault is set if a failure is detected in the EEPROM cell.	Failure detected in register of High End Timer	= True	Software State	= Init OR Running OR Shutdown	immediately	Type A, 1 Trip
		This monitoring strategy checks for proper of the High End Timer Transfer Unit (HETTU) addressing functionality. When a pointer error is detected, the HETTU state switches to a specific value. A fault is set if the HETTU is in the pointer error state.	High End Timer Transfer Unit Status	= "pointer error"	Software State	= Init OR Running OR Shutdown	Immediately	Type A, 1 Trip
		This monitoring strategy checks the High End Timer Transfer Unit (HETTU) internal bus. A fault is set if a bus error is detected.	High End Timer Transfer Unit Status	= "bus error"	Software State	= Init OR Running OR Shutdown	Immediately	Type A, 1 Trip
		This monitoring strategy checks the High End Timer Transfer Unit (HETTU) internal bus. A fault is set if a bus error is detected.	High End Timer Transfer Unit Status	= "busy bit error"	Software State	= Init OR Running OR Shutdown	Immediately	Type A, 1 Trip
		This monitoring strategy checks if there was a High End Timer Transfer Unit (HETTU) exception. A fault is set if an exception occurs.	Failure detected in register INT	= True	Software State	= Running	Immediately	Type A, 1 Trip

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if the eBoost internal motor driver enable signal line or the electrical enable signal line are in logical low. It is expected that the enable signal lines always stay at a high voltage level (except when the SW intends a different state). A fault is set if at least one of the pins reports a logical low.	Pin level of Motor Driver enable line OR Pin level of electrical enable line	= 0 (logical low)  = 0 (logical low)	Software State AND failsafe logic test	= Running OR Shutdown  = Finished	0.05 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if there was a task failed to call. A fault will be set if a task did not start in the expected time.	Watchdog detects a missing task	= True	Software State	= Init OR Running OR Shutdown	immediately	Type A, 1 Trip
		This monitoring strategy checks the system integrated circuit watchdog fault counter. A fault is set if this error counter exceeds a threshold.	Error counter	> 3	Software State	= Running OR Shutdown	immediately	Type A, 1 Trip
		This monitoring strategy checks if the watchdog trigger is received as expected. An incorrect watchdog trigger signal is sent to the system chip watchdog function, which increments the watchdog error counter. A fault is set if the watchdog fault counter is not incremented.	Incorrect watchdog data sent to chip	= True	Software State	= Running OR Shutdown	1 [sec]	Type A, 1 Trip
		This monitoring strategy checks if all possible watchdog triggers are received within a certain time by the system chip. A fault will be set if not all watchdog tasks are done in a certain period.	Number of watchdog tasks done	< Number of watchdog tasks	Software State	= Running OR Shutdown	0.45 [Sec]	Type A, 1 Trip
		This monitoring strategy checks the status of the watchdog. During the initialization test the watchdog status feedback from the system chip is tested against several patterns according to the ongoing sub test. A fault is set if the watchdog status is not as expected.	Watchdog status	≠ expected watchdog status	Software State	= Running OR Shutdown	1 [sec]	Type A, 1 Trip
		This monitoring strategy checks the status of the watchdog. After the Init test has finished, the status of the watchdog respectively the safety logic is being continuous Monitored. A fault will be set if the status is not as expected.	Watchdog status	≠ expected watchdog status	Software State	= Running OR Shutdown	0.05 [Sec]	Type A, 1 Trip
		This monitoring strategy checks correct handling of NMI. The Error Signal Module is the central module at the microcontroller level; it handles severe microcontroller core failures or peripheral failures, and coordinates the logic tests during start-up. A fault is set if the Non-Maskable Interrupt handler detects a failure During Init tests.	Non-Maskable Interrupt occurs	= True	Software State	= Init	immediately	Type A, 1 Trip

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if a severe microcontroller core or peripheral failure occurred. The Error Signal Module (ESM) is the central module at the microcontroller level; it handles severe microcontroller core or peripheral failures. A fault is set when severe microcontroller core or peripheral failures occurred.	A microcontroller core failure via Error Signal Module is detected OR Peripheral failure via ESM is detected	= True  = True	Software State	= Running OR Shutdown	immediately	Type A, 1 Trip
		This monitoring strategy checks whether the HET has the proper reference signal frequency. The monitor compares the defined frequency with the actual reference signal frequency, which is calculated by the HET. A fault is set if the difference between the defined frequency and the actual frequency exceeds a threshold.	Absolute(Defined frequency - calculated frequency) / defined frequency	> 0.05	Software State	= Running OR Shutdown	immediately	Type A, 1 Trip
		This monitoring strategy tests the Serial Peripheral Interface (SPI) functionality and failure handling of the Application Specific Integrated Circuits (ASIC) used in the system. To do so, the SPI component provides special functions to perform the following tests : - reading from/writing to an undefined address EEPROM cell - writing to a non-writable EEPROM cell - reading a EEPROM cell with a parity failure during transmission - reading a EEPROM cell with a clock failure during transmission For each of these tests, a certain fault response is expected from the ASIC. A fault is set if at least one fault response does not match the expected one.	No or wrong fault response from ASIC while reading from an undefined address register OR No or wrong fault response from ASIC while writing to an undefined address register OR No or wrong fault response from ASIC while writing to a non-writable register OR No or wrong fault response from ASIC while reading a register with a parity error in frame 1 during transmission OR No or wrong fault response from ASIC while reading a register with a parity error in frame 2 during transmission OR No or wrong fault response from ASIC while reading a register with a clock failure (less clock pulses) during transmission OR No or wrong fault response from ASIC while reading a register with a clock failure (more clock pulses) during transmission	= True  = True  = True  = True  = True  = True	Software State	= Init	immediately	Type A, 1 Trip

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		<p>The monitoring checks the received data by the Application Specific Integrated Circuit (ASIC). The ASIC of the system is connected to the microcontroller via a Serial Peripheral Interface (SPI). A fault is set if not all data has been transmitted or received.</p> <p>Parity check - The ASIC of the system is connected to the microcontroller via a serial Peripheral Interface (SPI). A fault is set if a wrong frame is transmitted.</p>	<p>Length of received data OR Calculated parity of the received data OR Time out error OR Actual transmitted bits OR Clock failure OR Data received</p>	<p>≠ length of send data  ≠ received parity bit  = True  ≠ bits in register  = True  ≠ bits in register</p>	Software State	= Init OR Running	0.001 [sec]	Type A, 1 Trip
		<p>This monitoring strategy checks if there is a Serial Peripheral Interface (SPI) communication failure. The Application Specific Integrated Circuits (ASIC) of the system are connected to the microcontroller via a SPI. The microcontroller includes hardware Monitoring of the ASIC to recognize failures of the necessary input signals. The Monitor reads the results of certain of this hardware Monitoring by reading out the ASIC EEPROM cell via Serial Peripheral Interface. A fault is set if charge-pump failure bit, or clock-input-signal failure bit, or internal-oscillator-circuit failure bit is set.</p>	<p>Charge-pump failure bit is set OR Clock-input-signal failure bit is set OR Internal-oscillator-circuit failure bit is set</p>	<p>= True  = True  = True</p>	Software State	= Init	0.2 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks the voltage comparators of the ASIC. The Application Specific Integrated Circuit (ASIC) has several voltage comparators to monitor the level of different voltage supplies. These comparators are tested at start-up for correct functionality, and the result of the test is stored as a EEPROM cell value. A fault is set if there is an error flag when the monitor reads the EEPROM cell value.	Error flag is set in a defined register	= True	Software State	= Init	Three consecutive ignition cycles	Type A, 1 Trip
		This monitoring strategy checks if there is a timeout of the Serial Peripheral Interface (SPI) communication to Application Specific Integrated Circuit (ASIC). The Application Specific Integrated Circuit (ASIC) of the system is connected to the microcontroller via a Serial Peripheral Interface (SPI). The goal is to monitor the duration of the SPI transmission. A fault is set if the SPI transfer to ASIC is not finished within a defined period.	Duration of SPI transfer to ASIC	> 0.005 Sec	Software State	= Init	0.05 [Sec]	Type A, 1 Trip
		The monitoring checks the received data by the Application Specific Integrated Circuit (ASIC). The ASIC of the system is connected to the microcontroller via a Serial Peripheral Interface (SPI). A fault is set if not all data has been transmitted or received. Parity check - The ASIC of the system is connected to the microcontroller via a serial Peripheral Interface (SPI). The monitoring checks the received data by the ASIC. A fault is set if the calculated parity does not match the parity bit. Bit check - The ASIC of the system is connected to the microcontroller via a serial Peripheral Interface (SPI). The monitoring checks the received data by the ASIC. A fault is set if at least one bit of the actual transmitted data is not equal to the transmit bit in register. Rationality check - The ASICs of the system is connected to the microcontroller via a serial Peripheral Interface (SPI). When ASIC detects a transmission failure, it sends an error frame via the SPI. The monitoring checks the frames transmitted via the SPI. A fault is set if an error frame is transmitted.	Length of received data OR Calculated parity of the received data OR Clock failure OR Actual transmitted bits OR Error frame received	≠ length of send data  ≠ received parity bit  = True  ≠ bits in register  ≠ bits in register	Software State	= Init OR Running OR Shutdown	0.05 [sec]	Type A, 1 Trip

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if there was an exception in Operating System. A fault is set if an exception occurs in the Operating System.	OS-exception occurs	= True	Software State	= Running OR Shutdown	immediately	Type A, 1 Trip
		This monitoring strategy checks if the Static Random Access Memory (SRAM) and peripheral Random Access Memory (RAM) are initialized or not. The SRAM and peripheral RAM are cleared at power-up. Then this Monitoring reads every SRAM and RAM addresses. A fault will be set if at least one adresse is not initialized to zero.	At least one RAM or SRAM bit	≠ 0	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks if a wrong hexfile was flashed in the AECU. The purpose of RTP pins is to do measurement of RAM variables. A fault is set if the RTP Enable pin is stuck to a high.	RTP Enable pin stuck to high	= True	Software State	= Init	Immediately	Type A, 1 Trip
		The System Mode Manager (SMM) asks in parallel with multiple system modes for the individual modules. To do this, it receives requests from different parts of software which are initialized at the beginning and after a while a valid value is given which is not "init" value. A fault is set if after a while one requester is still in init value.	One requester still in init value for time	> 3.6 Sec	Software State	= Running	3.6 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if the microcontroller stack has over or underflowed. During initialization, stack memory cells are set at the beginning and at the end of the stack area: these Stack memory cells are checked periodically. A fault is set if one of these Stack memory cells has been overwritten.	End-stack word overwritten OR Beginning-stack word overwritten	= True  = True	Software State	= Init	0.04 [sec]	Type A, 1 Trip
		This monitoring strategy checks the time to configure the Application Software, during the system startup. A fault will be set if it lasts longer than a defined period.	ASW configuration time	> 5 Sec	Software State	= Init	5 [Sec]	Type A, 1 Trip
		This monitoring strategy checks for an unsupported Bootblock and FSW clock configuration in ECU. Within an ECU, the Bootblock allows actualizing the application which is called FSW. A failure is set if the Bootblock and FSW clock settings are different.	Bootblock and FSW clock settings are different	= True	Software State	= Init	Immediately	Type A, 1 Trip

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if an internal fault has occurred in the operating system. A fault is set if software interrupts have occurred but: - the interrupt is invalid. - An interrupt lock release is called without previous lock. - not all interrupts are released.	Software interrupt occurred AND { Invalid interrupt occurred OR Interrupt lock release is called without previous lock OR Not all interrupts are released OR Interrupt lock time }	= True  = True  = True  = True  > 0.001 Sec	Software State	= Init OR Running OR Shutdown	Immediately	Type A, 1 Trip
		This monitoring strategy checks if interrupts are properly running. The error signal module is the central module in the microcontroller level. It handles severe microcontroller core failures or peripheral failures, and coordinates the logic tests during start-up. A fault is set if no or not expected non-maskable interrupt occurs during Init tests.	Failure detected during safety logic startup tests	= True	System voltage	> 6.9 V	Immediately	Type A, 1 Trip
		This monitoring strategy checks if the software is properly configured for the hardware. Software version and device identifiers of the Application Specific Integrated Circuit (ASIC) and of the microcontroller are compared with the software version and identifiers of the configuration software. A fault is set if a least one ID or software version does not match.	Received ID of microcontroller is not identical with the ID stored in the software	= True	Software State	Init	0.03 [sec]	Type A, 1 Trip
		This monitoring strategy checks if there are internal and input signal failures of the Application Specific Integrated Circuit (ASIC). The ASIC is connected to the microcontroller by Serial Peripheral Interface (SPI). The monitor reads the results of this hardware monitoring EEPROM cell using Serial Peripheral Interface. The bits of the EEPROM cell are set by the hardware logic "Voltage-Pre_regulator-Mode". A fault is set if the voltage-pre-regulator-mode failure bit is set.	Voltage-pre-regulator-mode failure bit is set	= True	Software State	= Running OR Shutdown	0.2 [Sec]	Type A, 1 Trip
		DTC PASS	Turn ignition on and wait for at least 30sec					
Control Module Long Term Memory Performance	P062F	This monitoring checks for a plausible EEPROM ceel defect. A fault is set if the "gap lap adjust" correction factor can not be read from the EEPROM	Gap lap adjust correction factor can not be read	= True	Software State	= Init	Immediately	Type A, 1 Trip

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks for a plausible EEPROM cell defect. A fault is set if the update of the plant Jump-In Gain adjustment failed.	Update of Plant Jump-In Gain Adjustment failed	= True	Software State	= Init	Immediately	Type A, 1 Trip
		This monitoring strategy checks if there is enough available space in the EEPROM (Electrically Erasable Programmable Read-Only Memory) to allocate a data field. A fault is set if the size of the data field is bigger than the amount of available space in EEPROM.	Data field size to allocate	> Available Space	Software State	= Init OR Running OR Shutdown	Immediately	Type A, 1 Trip
		This monitoring strategy checks if it is possible to write data in persistent storage. Every write access to non-volatile memory in the EEPROM (Electrically Erasable Programmable Read-Only Memory) is protected by timeout monitoring and data verification after writing. The Persistent Data Manager checks persistent data access in EEPROM. A fault is set if a write operation occurs or if data verification after writing fails.	Writing operation	> 0.025 Sec	Software State	= Running	Immediately	Type A, 1 Trip
		This monitoring strategy check if the the Master Cylinder pressure sensor offset can be written. A fault is set if the value can not be written in the EEPROM during postrun	write failure occurred	= True	Software State	= Shutdown	Immediately	Type A, 1 Trip
		This monitoring checks if there is no write failure during the system shutdown phase. A fault is set if values can not be written in the EEPROM during postrun	write failure occurred	= True	Software State	= Shutdown	0.02 [Sec]	Type A, 1 Trip
		This monitoring checksthe CAN initialization function has taken too long to finish . The access to message Ram by the CAN-Core is handle through a message interface register. In each cycle a CAN register bit is checked to determine if the bit is set. A fault is set if the loop lasts longer than a threshold	Number of CAN cycles	> 1000	Software State	= Running	0.02 [Sec]	Type A, 1 Trip
		This monitoring checksthe CAN initialization function has taken too long to finish . The access to message Ram by the CAN-Core is handle through a message interface register. In each cycle a CAN register bit is checked to determine if the bit is set. A fault is set if the loop lasts longer than a threshold	Number of CAN cycles	> 1000	Software State	= Running	0.02 [Sec]	Type A, 1 Trip
		<b>DTC PASS</b>	Turn ignition on and wait for at least 5sec					
Control Module Long Term Memory Reset	P0603	This monitoring cheks for a plausible EEPROM cell defect. A fault is set if the regenerative braking counter value can not be read from the EEPROM	Regenerative braking counter value can not be read	= True	Software State	= Init	Immediately	Type A, 1 Trip

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring checks for a plausible EEPROM cell defect. A fault is set if the delta dead volume of the Pressure-Volume (pV) characteristics can not be read from the EEPROM	Delta dead volume of the pV characteristics can not be read	= True	Software State	= Init	Immediately	Type A, 1 Trip
		This monitoring checks for a plausible EEPROM cell defect. A fault is set if the Pressure-Volume characteristics correction factor can not be read from the EEPROM.	Pressure-Volume characteristics correction factor can not be read	= True	Software State	= Init	Immediately	Type A, 1 Trip
		This monitoring strategy checks the stored value of Electric Motor idle position. The rotor idle position is written to an EEPROM cell at the end of the production line. This EEPROM cell is read at Ignition State. A fault will be set if the stored value of the "Motor_IdlePositionTravel" could not be read from EEPROM cell.	Read failure occurs	= True	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks if there is no calibration of electric motor idle position. The rotor idle position is written to a EEPROM cell of an EEPROM at end of production line. This EEPROM cell is read at Ignition State. A fault is set if the EEPROM cell is empty.	Register is empty	= True	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks if the stored Electric Motor angle at the lower end stop position can be read. The brake booster electric motor angle at the lower end stop position is measured and written to an EEPROM cell at the end of the production line. This EEPROM cell is read at Ignition State. A fault is set if a read failure occurs.	Read failure occurs	= True	Software State	= Init	immediately	Type A, 1 Trip
		This Monitoring checks that one value of the eBoost basic Init conditions is available. The brake booster motor angle at backwards bound is measured and written to an EEPROM cell at end of production line. This EEPROM cell is read at Ignition State. A fault is set if the EEPROM cell is empty.	Register is empty	= True	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks if there is a reading problem of the EEPROM. The plunger release position is written to an EEPROM cell of an EEPROM at the end of the production line. This EEPROM cell is read at Ignition State. A fault is set if a read failure occurs.	Read failure occurs	= True	Software State	= Init	immediately	Type A, 1 Trip

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if data in EEPROM is empty. The plunger release position is written to a EEPROM cell the end of production line. This EEPROM cell is read at Ignition State. A fault is set if the EEPROM cell is empty.	Register is empty	= True	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks if the customer identifier is correct. At Init, the persistent data manager checks the mismatch of the EEPROM cell value and expected customer ID. A fault is set if the expected customer ID does not match with the stored customer ID.	Stored customer ID	≠ expected customer ID	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks if the system do not find the enhanced platform software end marker which is use to help the system to find the end of data. At ignition state the Persistent Data Manager checks the content of the EEPROM. A fault is set if the enhanced platform software end marker has not been found.	No enhanced platform software end marker in EEPROM	= True	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks the stored data field size is correct. At Ignition State, the Persistent Data Manager checks the content of the EEPROM. A fault is set if a data field size in EEPROM does not match data item configuration in software.	Data field size in the EEPROM	≠ data size configuration in software	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks the reading accessibility of the EEPROM. At Init, the Persistent Data Manager checks the content of the EEPROM. A fault is set if an access error occurs while reading the EEPROM.	Read error occurs OR Not expected Non-Markable Interrupt detected	= True  = True	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks if a stored BPTS value can be read. The BPTS detects the position of the brake pedal. Before providing proper values, the BPTS has to be calibrated using calibration values stored in an EEPROM cell. This EEPROM cell is read during the eBoost initialization state. A fault is set if a read failure occurs.	read failure occurred	= True	Software State	= Init	immediately	Type A, 1 Trip

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if the EEPROM cell which contains the calibrations value of the Brake Pedal Travel Sensor (BPTS) is empty. The BPTS provides two separate signals with different transmissions and signal conditionings. Each signal is calibrated at end of production line, and calibration values are written to a cell of an EEPROM. This EEPROM cell is read at Ignition State. A fault is set if the EEPROM cell is empty.	Register is empty	= True	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks if the calibrated position value can be read. The Brake Pedal Travel Sensor (BPTS) detects the position of the brake pedal. Before providing proper values, it has to be calibrated by using calibration values stored in an EEPROM cell. This EEPROM cell is read at Init State. A fault is set if a read failure occurs.	Read failure occurs	= True	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks if the calibrated offset value can be read. The Brake Pedal Travel Sensor (BPTS) detects the position of the brake pedal. Before providing proper values, it has to be calibrated by using calibration values stored in an EEPROM cell. This EEPROM cell is read at Init State. A fault is set if a read failure occurs.	Read failure occurs	= True	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks if the EEPROM cell which contains the calibrated offset value is empty. The Brake Pedal Travel Sensor (BPTS) detects the position of the brake pedal. Before providing proper values, it has to be calibrated by using calibration values stored in a EEPROM cell in an EEPROM memory. This EEPROM cell is read at Ignition State. A fault is set if the EEPROM cell is empty.	Register is empty	= True	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks if the calibrated value can be read. The Brake Pedal Travel Sensor (BPTS) detects the position of the brake pedal. Before providing proper values, it has to be calibrated by using calibration values stored in an EEPROM cell in an EEPROM memory. This EEPROM cell is read at Init State. A fault is set if a read failure occurs.	Read failure occurs	= True	Software State	= Init	immediately	Type A, 1 Trip

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if the calibrated offset value can be read. The Brake Pedal Travel Sensor (BPTS) detects the position of the brake pedal. Before providing proper values, it has to be calibrated by using calibration values stored in an EEPROM cell. This EEPROM cell is read at Init State. A fault is set if a read failure occurs.	Read failure occurs	= True	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks if the EEPROM cell which contains the calibrations value is empty. The Brake Pedal Travel Sensor (BPTS) detects the position of the brake pedal. Before providing proper values, it has to be calibrated by using calibration values stored in an EEPROM cell. This EEPROM cell is read at Ignition State. A fault is set if the EEPROM cell is empty.	Register is empty	= True	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks the compensation of the 1, 2, 6 or 8 order of RPS signal. A fault is set if the compensation of 1, 2, 6 or 8 order of RPS signal is not working due to a lack of informations of the EEPROM.	Lack of information of the EEPROM for RPS	= True	Software State	= Init	0.005 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if a stored value of RPS x-value offset could be read. The correction value for the X raw signal of the Rotor Position Sensor (RPS) is written to an EEPROM cell at end of production line. This EEPROM cell is read at Init State. A fault is set if a read failure occurs.	Read failure occurs	= True	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks if the EEPROM cell which contains the offset of the X-value of RPS is empty. The correction value for the X raw signal of the Rotor Position Sensor (RPS) is written to an EEPROM cell at the end of the production line. This EEPROM cell is read at Ignition State. A fault is set if the EEPROM cell is empty.	Register is empty	= True	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks if a stored value of RPS y value offset could be read. The correction value for the Y raw signal of the Rotor Position Sensor (RPS) is written to an EEPROM cell at end of production line. This EEPROM cell is read at Init State. A fault is set if a read failure occurs.	Read failure occurs	= True	Software State	= Init	immediately	Type A, 1 Trip

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if the EEPROM cell which contains the offset of the Y-value of RPS is empty. The correction value for the Y raw signal of the Rotor Position Sensor (RPS) is written to an EEPROM cell at the end of the production line. This EEPROM cell is read at Ignition State. A fault is set if the EEPROM cell is empty.	Register is empty	= True	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks if a stored value of RPS synchronicity could be read. The amplitude synchronicity of the X and Y raw values of the Rotor Position Sensor (RPS) is written to an EEPROM cell at end of production line. This EEPROM cell is read at Init State. A fault is set if a read failure occurs.	Read failure occurs	= True	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks if the EEPROM cell which contains the offset of the X-value of RPS is empty. The amplitude synchronicity of the X and Y raw values of the Rotor Position Sensor (RPS) are written to an EEPROM cell at the end of the production line. This EEPROM cell is read at Ignition State. A fault is set if the EEPROM cell is empty.	Register is empty	= True	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks if the Rotor Position Sensor (RPS) offset can be read. The RPS offset is written to an EEPROM cell at end of production line. This EEPROM cell is read at Init State. A fault is set if a read failure occurs.	Read failure occurs	= True	Software State	= Init	immediately	Type A, 1 Trip
		This monitoring strategy checks if the EEPROM cell which contains the offset of the RPS is empty. The rotor idle position is written to an EEPROM cell at the end of the production line. This EEPROM cell is read at Ignition State. A fault is set if the EEPROM cell is empty.	Register is empty	= True	Software State	= Init	immediately	Type A, 1 Trip
		DTC PASS	Turn ignition off and wait at least 90 sec, turn ignition on and wait 5sec					

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Control Module Random Access Memory (RAM)	P0604	This monitoring strategy checks the values of a specific RAM area. Furthermore, the address decoder is tested using test patterns to ensure bus integrity. The test writes different patterns at the addresses of this RAM area. Addresses are then read out and a signature for all the readout values is calculated. The original content in RAM is afterwards rewritten. The order of the patterns is chosen so that the signature the multibit and coupling failures can be set during the signature evaluation. A fault is set if a multibit or coupling failure is detected.	Multi-bits failure detected OR Coupling failure detected OR Address decoder test detects an error	= True  = True  = True	System voltage	> 6.9 V	Immediately	Type A, 1 Trip
		This monitoring strategy checks correct functionality of Random Access Memory (RAM). A programmable Built In Self Test runs in start-up phase. It is a test implemented in hardware, triggered and evaluated in software. A fault is set if the memory test detects a failure.	Memory test detects a fault	= True	Software State	= Init	Immediately	Type A, 1 Trip
		This monitoring strategy checks if there is a single bit error at RAM. Because of Error Correction Code, RAM single-bit errors are always corrected. A fault will be set if the number of bit errors exceeds a threshold.	Number of detected single-bit errors	> 2	Software State	= Running OR Shutdown	immediately	Type A, 1 Trip
		DTC PASS	Turn ignition on and wait for at least 5sec					
Control Module Read Only Memory (ROM)	P0601	This monitoring strategy checks the correct CRC of Flash EEPROM. Initially and cyclically the complete Flash EEPROM contents is checked by calculating a CRC value and comparing it with the checksum generated during the software build process. A fault is set if a double bit error of Flash EEPROM is detected, or if more than a number of single bit errors are detected (otherwise single bit errors are corrected).	Double bit error detected OR Number of detected single bit errors	= True  > 1	Software State	= Init OR Running OR Shutdown	immediately During Startup or respectively after 60 sec for cyclic flash checksum test.	Type A, 1 Trip
			DTC PASS	Turn ignition on and wait for at least 5sec				
Extended Brake Pedal Travel	C0075	This monitoring strategy checks if the differential stroke is in range. Due to a mechanical coupling of the boost body and the pedal travel sensor, the differential stroke can only have defined range. A fault is set if the differential stroke exceeds the range.	brake pedal stroke - boost body stroke	< - 5.0 mm	Software State	= Running OR Shutdown	0.04 [Sec]	Type A, 1 Trip
			DTC PASS	Turn ignition on and wait for at least 5sec				
Ignition Switch - Accessory Position - Circuit Low	P2537	Detects an accessory position circuit open	Accessory .	= False	Propulsion System Active Propulsion System Active Time	= True > 0.5 Sec	0.5 [sec]	Type B, 2 Trips

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Ignition Switch - Circuit High	P2535	Detects if the Run/Crank input circuit is high	Short to Battery	> 5 V	CAN Communication And ECM Run/Crank Active Data	= Enabled  = False	2.5 [sec]	Type A, 1 Trip
Ignition Switch - Circuit Low	P2534	Detects if the Run/Crank input circuit is low	Short to Ground Or Open Condition	< 2 V  = True	CAN Communication And ECM Run/Crank Active Data	= Enabled  = Active	2.5 [sec]	Type A, 1 Trip
Internal Control Module A/D Processing Performance	P060B	This monitoring strategy checks the conversion time of the ADC (Analog Digital Converter). The ADC periodically reads an analog signal and converts it into digital values. Before starting a new conversion, the monitor checks that the previous conversion is finished. A fault is set if the previous conversion is not finished for a number of checks.	number of conversions which could not be finished in time	> 9	Software State	= Running	0.003 [sec]	Type A, 1 Trip
		This monitoring strategy checks proper functionality of ADC self-test. To do this, ADC channels are switched to two predefined internal microcontroller resistors to measure defined (voltage) levels (high and low). The absolute differences between the two measurements are calculated in unit digits. A fault will be set if the difference is greater than a threshold.	Absolute( difference between the two ADC measurements)	> 540 digits	Software State	= Running	0.2 [sec]	Type A, 1 Trip
		DTC PASS	Turn ignition on and wait for at least 5sec					
Lost Communication with Brake System Control Module on Bus E	U1833	This monitoring strategy checks if no messages are sent. The network driver has to send and receive all network messages. At the same time it has to check that the messages are correct (length, checksum, alive-counter, reception timeout). The diagnostic performs a Time out check. A fault is set if no message is received within a defined amount of time.	0x21B not received on Bus E	= True	System voltage AND System voltage AND Bus Off Fault Active ECU is sending/receiving on CAN AND ECU Power Mode transition diagnostic enable delay timer	> 7.5 V  < 16 V  = False = True  ≥ 5 Sec	0.1 [Sec]	Type A, 1 Trip
		This monitoring strategy checks if no messages are sent. The network driver has to send and receive all network messages. At the same time it has to check that the messages are correct (length, checksum, alive-counter, reception timeout). The diagnostic performs a Time out check. A fault is set if no message is received within a defined amount of time.	0x21E not received on Bus E	= True	System voltage AND System voltage AND Bus Off Fault Active ECU is sending/receiving on CAN AND ECU Power Mode transition diagnostic enable delay timer	> 7.5 V  < 16 V  = False = True  ≥ 5 Sec	0.1 [Sec]	Type A, 1 Trip

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Lost Communication With ECM/PCM "A"	U0100	This monitoring strategy checks if no messages are sent. The network driver has to send and receive all network messages. At the same time it has to check that the messages are correct (length, checksum, alive-counter, reception timeout). The diagnostic performs a Time out check. A fault is set if no message is received within a defined amount of time.	0xC9 not received on Bus A	= True	System voltage AND System voltage AND Bus Off Fault Active ECU is sending/receiving on CAN AND ECU Power Mode transition diagnostic enable delay timer	> 7.5 V  < 16 V  = False = True  ≥ 5 Sec	0.25 [sec]	Type B, 2 Trips
		This monitoring strategy checks if no messages are sent. The network driver has to send and receive all network messages. At the same time it has to check that the messages are correct (length, checksum, alive-counter, reception timeout). The diagnostic performs a Time out check. A fault is set if no message is received within a defined amount of time.	0x4C1 not received on Bus A	= True	System voltage AND System voltage AND Bus Off Fault Active ECU is sending/receiving on CAN AND ECU Power Mode transition diagnostic enable delay timer	> 7.5 V  < 16 V  = False = True  ≥ 5 Sec	1.25 [sec]	Type B, 2 Trips
Lost Communication With Hybrid Powertrain Control Module	U0293	This monitoring strategy checks if no messages are sent. The network driver has to send and receive all network messages. At the same time it has to check that the messages are correct (length, checksum, alive-counter, reception timeout). The diagnostic performs a Time out check. A fault is set if no message is received within a defined amount of time.	0x1DF not received on Bus A	= True	System voltage AND System voltage AND Bus Off Fault Active ECU is sending/receiving on CAN AND ECU Power Mode transition diagnostic enable delay timer	> 7.5 V  < 16 V  = False = True  ≥ 5 Sec	0.1 [Sec]	Type A, 1 Trip
Sensor Reference Voltage "A" Circuit Range/Performance	P06A6	This monitoring strategy checks if the BPTS supply voltage is in range. The Brake Booster Electronic Control Unit (ECU) evaluates the supply voltage of the brake pedal position sensors. A fault is set if the supply voltage is outside of a certain range.	BPTS supply voltage OR BPTS supply voltage	< 4.68 V  > 5.32 V	Software State	= Init OR Running OR Shutdown	0.06 [Sec]	Type A, 1 Trip
		DTC PASS	Turn ignition on and wait for at least 5sec					
Sensor Reference Voltage "B" Circuit Range/Performance	P06A7	This monitoring strategy checks if the RPS1 supply voltage is in range. Periodically the RPS1 IC transmits a safety word together with raw values. The voltage-flag of the RPS1 safety word indicates either one of the following errors (failure modes cannot be distinguished): • Under voltage error • Over voltage error • Open circuit A fault is set if the voltage-flag of the RPS1 safety word is set.	voltage-flag of RPS1 safety word set	= True	Software State	= Running OR Shutdown	0.02 [Sec]	Type A, 1 Trip
		DTC PASS	Turn ignition on and wait for at least 5sec					

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
Sensor Reference Voltage A Circuit Low	P0642	This monitoring strategy checks if the BPTS supply under voltage. A fault is set if BPTS under voltage is caused by Voltage Sensor3 under voltage.	BPTS supply voltage AND Voltage Sensor3	< 4.68 V  < 5.6 V	Software State	= Running OR Shutdown	0.06 [Sec]	Type A, 1 Trip
		DTC PASS	Turn ignition on and wait for at least 5sec					
System Configuration Error	C1449	This monitoring strategy checks if the calibrated idle position can be reached at the end of BPTS calibration routine at end of production line.	Idle position not reached	= True	Software State	= Diag	immediately	Type A, 1 Trip
		This monitoring strategy checks if all written BPTS calibration values can be read at the end of production line.	read failure occurred	= True	Software State	= Diag	immediately	Type A, 1 Trip
		This monitoring strategy checks if the BPTS calibration routine has been completed at the end of production line	Calibration routine aborted	= True	Software State	= Diag	immediately	Type A, 1 Trip
		This monitoring checks if the pre drive check is missed at the end of the production line	Pre drive check missed	= True	Software State	= Diag	immediately	Type A, 1 Trip
		This monitoring strategy checks if measured value for idle position at OES calibration routine can be written. A fault is set if the value can not be written in the EEPROM at the end of the production line	write failure occurred	= True	Software State	= Diag	immediately	Type A, 1 Trip
		This monitoring strategy checks if measured electric motor angle value at OES calibration routine can be written. A fault is set if the value can not be written in the EEPROM at the end of the production line	write failure occurred	= True	Software State	= Diag	immediately	Type A, 1 Trip
		This monitoring strategy checks if the measured value of punger release position at OES calibration routine can be written. A fault is set if the value can not be written in the EEPROM at the end of the production line	write failure occurred	= True	Software State	= Diag	immediately	Type A, 1 Trip
		This monitoring strategy checks if the BPTS hysteresis value can be written. A fault is set if the value can not be written in the EEPROM at the end of the production line	write failure occurred	= True	Software State	= Diag	immediately	Type A, 1 Trip
		This monitoring strategy checks if the BPTS1 offset based on mounting position can be written. A fault is set if the value can not be written in the EEPROM at the end of the production line	write failure occurred	= True	Software State	= Diag	immediately	Type A, 1 Trip

## 16 OBDG02 BSC2 Summary Tables

Component/ System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL illum.
		This monitoring strategy checks if the BPTS2 offset based on mounting position can be written. A fault is set if the value can not be written in the EEPROM at the end of the production line	write failure occurred	= True	Software State	= Diag	immediately	Type A, 1 Trip
		This monitoring strategy checks if the calibration value of BPTS1 has been written at the end of production line.	write failure occurred	= True	Software State	= Diag	immediately	Type A, 1 Trip
		This monitoring strategy checks if the calibration value of BPTS2 has been written at the end of production line.	write failure occurred	= True	Software State	= Diag	immediately	Type A, 1 Trip
		This monitoring strategy checks if the RPS1 X value offset can be written. A fault is set if the value can not be written in the EEPROM at the end of the production line	write failure occurred	= True	Software State	= Diag	immediately	Type A, 1 Trip
		This monitoring strategy checks if the offset Y value of RPS1 can be written. A fault is set if the value can not be written in the EEPROM at the end of the production line	write failure occurred	= True	Software State	= Diag	immediately	Type A, 1 Trip
		This monitoring strategy checks if the synchronicity value of RPS1 can be written. A fault is set if the value can not be written in the EEPROM at the end of the production line	write failure occurred	= True	Software State	= Diag	immediately	Type A, 1 Trip

## 16 OBDG02 DTC Description

DTC Description	BSC2 Disabling DTCs
P057C Brake Pedal Position Sensor "A" Circuit Low (continued)	P0642 Sensor Reference Voltage A Circuit Low
	P06A6 Sensor Reference Voltage "A" Circuit Range/Performance
	U3501 Control Module Input Power "A" Circuit Low
P057D Brake Pedal Position Sensor "A" Circuit High	P057B Brake Pedal Position Sensor "A" Circuit Range/Performance
	P057C Brake Pedal Position Sensor "A" Circuit Low
	P057E Brake Pedal Position Sensor "A" Circuit Intermittent/Erratic
	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	P0642 Sensor Reference Voltage A Circuit Low
	P06A6 Sensor Reference Voltage "A" Circuit Range/Performance
	U3501 Control Module Input Power "A" Circuit Low
	P057E Brake Pedal Position Sensor "A" Circuit Intermittent/Erratic
P057C Brake Pedal Position Sensor "A" Circuit Low	
P057D Brake Pedal Position Sensor "A" Circuit High	
P0601 Control Module Read Only Memory (ROM)	
P0603 Control Module Long Term Memory Reset	
P0604 Control Module Random Access Memory (RAM)	
P0606 Control Module Internal Performance	
P060B Internal Control Module A/D Processing Performance	
P062F Control Module Long Term Memory Performance	
P0642 Sensor Reference Voltage A Circuit Low	
P06A6 Sensor Reference Voltage "A" Circuit Range/Performance	
U3501 Control Module Input Power "A" Circuit Low	
P05DC Brake Pedal Position Sensor "B" Circuit Range/Performance	
	P05DE Brake Pedal Position Sensor "B" Circuit High
	P05DF Brake Pedal Position Sensor "B" Circuit Intermittent/Erratic
	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	P0642 Sensor Reference Voltage A Circuit Low
	P06A6 Sensor Reference Voltage "A" Circuit Range/Performance
	U3501 Control Module Input Power "A" Circuit Low
	P05DD Brake Pedal Position Sensor "B" Circuit Low
P05DE Brake Pedal Position Sensor "B" Circuit High	
P05DF Brake Pedal Position Sensor "B" Circuit Intermittent/Erratic	
P0601 Control Module Read Only Memory (ROM)	
P0603 Control Module Long Term Memory Reset	

## 16 OBDG02 DTC Description

DTC Description		BSC2 Disabling DTCs	
P05DD	Brake Pedal Position Sensor "B" Circuit Low (continued)	P0606	Control Module Internal Performance
		P060B	Internal Control Module A/D Processing Performance
		P062F	Control Module Long Term Memory Performance
		P0642	Sensor Reference Voltage A Circuit Low
		P06A6	Sensor Reference Voltage "A" Circuit Range/Performance
		U3501	Control Module Input Power "A" Circuit Low
P05DE	Brake Pedal Position Sensor "B" Circuit High	P05DC	Brake Pedal Position Sensor "B" Circuit Range/Performance
		P05DD	Brake Pedal Position Sensor "B" Circuit Low
		P05DF	Brake Pedal Position Sensor "B" Circuit Intermittent/Erratic
		P0601	Control Module Read Only Memory (ROM)
		P0603	Control Module Long Term Memory Reset
		P0604	Control Module Random Access Memory (RAM)
		P0606	Control Module Internal Performance
		P060B	Internal Control Module A/D Processing Performance
		P062F	Control Module Long Term Memory Performance
		P0642	Sensor Reference Voltage A Circuit Low
		P06A6	Sensor Reference Voltage "A" Circuit Range/Performance
		U3501	Control Module Input Power "A" Circuit Low
P05DF	Brake Pedal Position Sensor "B" Circuit Intermittent/Erratic	P05DC	Brake Pedal Position Sensor "B" Circuit Range/Performance
		P05DD	Brake Pedal Position Sensor "B" Circuit Low
		P05DE	Brake Pedal Position Sensor "B" Circuit High
		P0601	Control Module Read Only Memory (ROM)
		P0603	Control Module Long Term Memory Reset
		P0604	Control Module Random Access Memory (RAM)
		P0606	Control Module Internal Performance
		P060B	Internal Control Module A/D Processing Performance
		P062F	Control Module Long Term Memory Performance
		P0642	Sensor Reference Voltage A Circuit Low
		P06A6	Sensor Reference Voltage "A" Circuit Range/Performance
		U3501	Control Module Input Power "A" Circuit Low
P05E0	Brake Pedal Position Sensor "A"/"B" Correlation	P057B	Brake Pedal Position Sensor "A" Circuit Range/Performance
		P057C	Brake Pedal Position Sensor "A" Circuit Low
		P057D	Brake Pedal Position Sensor "A" Circuit High
		P057E	Brake Pedal Position Sensor "A" Circuit Intermittent/Erratic
		P05DC	Brake Pedal Position Sensor "B" Circuit Range/Performance
		P05DD	Brake Pedal Position Sensor "B" Circuit Low
		P05DE	Brake Pedal Position Sensor "B" Circuit High
		P05DF	Brake Pedal Position Sensor "B" Circuit Intermittent/Erratic
		P0601	Control Module Read Only Memory (ROM)
		P0603	Control Module Long Term Memory Reset
		P0604	Control Module Random Access Memory (RAM)
		P0606	Control Module Internal Performance
		P060B	Internal Control Module A/D Processing Performance
		P062F	Control Module Long Term Memory Performance
		P0642	Sensor Reference Voltage A Circuit Low
		P06A6	Sensor Reference Voltage "A" Circuit Range/Performance
		U3501	Control Module Input Power "A" Circuit Low

## 16 OBDG02 DTC Description

DTC Description	BSC2 Disabling DTCs
P062F Control Module Long Term Memory Performance (continued)	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P0642 Sensor Reference Voltage A Circuit Low
	P06A6 Sensor Reference Voltage "A" Circuit Range/Performance
	U3501 Control Module Input Power "A" Circuit Low
	U3509 Control Module Input Power "C" Circuit Low
	U350A Control Module Input Power "C" Circuit High
	P0642 Sensor Reference Voltage A Circuit Low
P0603 Control Module Long Term Memory Reset	
P0604 Control Module Random Access Memory (RAM)	
P0606 Control Module Internal Performance	
P060B Internal Control Module A/D Processing Performance	
P062F Control Module Long Term Memory Performance	
P06A6 Sensor Reference Voltage "A" Circuit Range/Performance	
U3501 Control Module Input Power "A" Circuit Low	
P06A6 Sensor Reference Voltage "A" Circuit Range/Performance	
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	P0642 Sensor Reference Voltage A Circuit Low
	U3501 Control Module Input Power "A" Circuit Low
	P06A7 Sensor Reference Voltage "B" Circuit Range/Performance
C0594 Brake Booster Motor "A" Performance	
C1275 Brake Booster Rotor Position Sensor Unexpected Reset	
C1276 Brake Booster Rotor Position Sensor Message Counter Incorrect	
C1277 Brake Booster Rotor Position Sensor Configuration Error	
P0601 Control Module Read Only Memory (ROM)	
P0603 Control Module Long Term Memory Reset	
P0604 Control Module Random Access Memory (RAM)	
P0606 Control Module Internal Performance	
P060B Internal Control Module A/D Processing Performance	
P062F Control Module Long Term Memory Performance	
U3501 Control Module Input Power "A" Circuit Low	
P2534 Ignition Switch - Circuit Low	
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	P2535 Ignition Switch - Circuit High
	U3501 Control Module Input Power "A" Circuit Low

## 16 OBDG02 DTC Description

DTC Description	BSC2 Disabling DTCs
P2535 Ignition Switch - Circuit High	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	P2534 Ignition Switch - Circuit Low
	U3501 Control Module Input Power "A" Circuit Low
P2537 Ignition Switch - Accessory Position - Circuit Low	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	U3501 Control Module Input Power "A" Circuit Low
U0073 Control Module Communication High Speed CAN Bus Off - Generic	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	U3501 Control Module Input Power "A" Circuit Low
	U3502 Control Module Input Power "A" Circuit High
U0077 Control Module Communication Chassis Expansion CAN Bus Off - Generic	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	U3501 Control Module Input Power "A" Circuit Low
	U3502 Control Module Input Power "A" Circuit High
U0100 Lost Communication With ECM/PCM "A"	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	U0073 Control Module Communication High Speed CAN Bus Off - Generic
	U3501 Control Module Input Power "A" Circuit Low
	U3502 Control Module Input Power "A" Circuit High

## 16 OBDG02 DTC Description

DTC Description	BSC2 Disabling DTCs	
U0293 Lost Communication With Hybrid Powertrain Control Module	P0601	Control Module Read Only Memory (ROM)
	P0603	Control Module Long Term Memory Reset
	P0604	Control Module Random Access Memory (RAM)
	P0606	Control Module Internal Performance
	P060B	Internal Control Module A/D Processing Performance
	P062F	Control Module Long Term Memory Performance
	U0073	Control Module Communication High Speed CAN Bus Off - Generic
	U3501	Control Module Input Power "A" Circuit Low
U1833 Lost Communication with Brake System Control Module on Bus E	C1278	Brake System Information 1 Message Counter Incorrect
	C1279	Brake System Information 2 Message Counter Incorrect
	P0601	Control Module Read Only Memory (ROM)
	P0603	Control Module Long Term Memory Reset
	P0604	Control Module Random Access Memory (RAM)
	P0606	Control Module Internal Performance
	P060B	Internal Control Module A/D Processing Performance
	P062F	Control Module Long Term Memory Performance
	U0077	Control Module Communication Chassis Expansion CAN Bus Off - Generic
	U3501	Control Module Input Power "A" Circuit Low
	U3502	Control Module Input Power "A" Circuit High
U3007 Control Module Input Power "B" Circuit/Open	P0601	Control Module Read Only Memory (ROM)
	P0603	Control Module Long Term Memory Reset
	P0604	Control Module Random Access Memory (RAM)
	P0606	Control Module Internal Performance
	P060B	Internal Control Module A/D Processing Performance
	P062F	Control Module Long Term Memory Performance
	U3019	Control Module Input Power Circuit "B/C" Correlation
	U3501	Control Module Input Power "A" Circuit Low
U3018 Control Module Input Power Circuit "A/B" Correlation	P0601	Control Module Read Only Memory (ROM)
	P0603	Control Module Long Term Memory Reset
	P0604	Control Module Random Access Memory (RAM)
	P0606	Control Module Internal Performance
	P060B	Internal Control Module A/D Processing Performance
	P062F	Control Module Long Term Memory Performance
	U3501	Control Module Input Power "A" Circuit Low
	U3505	Control Module Input Power "B" Circuit Low
U3019 Control Module Input Power Circuit "B/C" Correlation	P0601	Control Module Read Only Memory (ROM)
	P0603	Control Module Long Term Memory Reset
	P0604	Control Module Random Access Memory (RAM)
	P0606	Control Module Internal Performance
	P060B	Internal Control Module A/D Processing Performance
	P062F	Control Module Long Term Memory Performance
	U3007	Control Module Input Power "B" Circuit/Open
	U3501	Control Module Input Power "A" Circuit Low

## 16 OBDG02 DTC Description

DTC Description	BSC2 Disabling DTCs	
U3501 Control Module Input Power "A" Circuit Low	P0601 Control Module Read Only Memory (ROM)	
	P0603 Control Module Long Term Memory Reset	
	P0604 Control Module Random Access Memory (RAM)	
	P0606 Control Module Internal Performance	
	P060B Internal Control Module A/D Processing Performance	
	P062F Control Module Long Term Memory Performance	
U3502 Control Module Input Power "A" Circuit High	P0601 Control Module Read Only Memory (ROM)	
	P0603 Control Module Long Term Memory Reset	
	P0604 Control Module Random Access Memory (RAM)	
	P0606 Control Module Internal Performance	
	P060B Internal Control Module A/D Processing Performance	
	P062F Control Module Long Term Memory Performance	
	U3501 Control Module Input Power "A" Circuit Low	
U3505 Control Module Input Power "B" Circuit Low	C057F Brake Booster Motor "A" Phase U-V-W Circuit/Open	
	C0580 Brake Booster Motor "A" Phase U-V-W Circuit Low	
	C0582 Brake Booster Motor "A" Phase U-V-W Circuit Range/Performance	
	C0590 Brake Booster Motor "A" Phase U-V-W Current High	
	C0591 Brake Booster Motor "A" Phase U-V-W Current Low	
	C0595 Brake Booster Internal Power Driver Range/Performance	
	C0596 Brake Booster Motor "A" Current Sensor Circuit Range/Performance	
	P05DC Brake Pedal Position Sensor "B" Circuit Range/Performance	
	P05DD Brake Pedal Position Sensor "B" Circuit Low	
	P05DE Brake Pedal Position Sensor "B" Circuit High	
	P05DF Brake Pedal Position Sensor "B" Circuit Intermittent/Erratic	
	P0601 Control Module Read Only Memory (ROM)	
	P0603 Control Module Long Term Memory Reset	
	P0604 Control Module Random Access Memory (RAM)	
	P0606 Control Module Internal Performance	
	P060B Internal Control Module A/D Processing Performance	
	P062F Control Module Long Term Memory Performance	
	P0642 Sensor Reference Voltage A Circuit Low	
	P06A6 Sensor Reference Voltage "A" Circuit Range/Performance	
	U3007 Control Module Input Power "B" Circuit/Open	
	U3018 Control Module Input Power Circuit "A/B" Correlation	
	U3019 Control Module Input Power Circuit "B/C" Correlation	
	U3501 Control Module Input Power "A" Circuit Low	
	U3506 Control Module Input Power "B" Circuit High	
	U3506 Control Module Input Power "B" Circuit High	C057F Brake Booster Motor "A" Phase U-V-W Circuit/Open
		C0580 Brake Booster Motor "A" Phase U-V-W Circuit Low
		C0582 Brake Booster Motor "A" Phase U-V-W Circuit Range/Performance
C0590 Brake Booster Motor "A" Phase U-V-W Current High		
C0591 Brake Booster Motor "A" Phase U-V-W Current Low		
C0595 Brake Booster Internal Power Driver Range/Performance		
C0596 Brake Booster Motor "A" Current Sensor Circuit Range/Performance		
P05DC Brake Pedal Position Sensor "B" Circuit Range/Performance		
P05DD Brake Pedal Position Sensor "B" Circuit Low		

## 16 OBDG02 DTC Description

DTC Description	BSC2 Disabling DTCs
U3506 Control Module Input Power "B" Circuit High (continued)	P05DE Brake Pedal Position Sensor "B" Circuit High
	P05DF Brake Pedal Position Sensor "B" Circuit Intermittent/Erratic
	P0601 Control Module Read Only Memory (ROM)
	P0603 Control Module Long Term Memory Reset
	P0604 Control Module Random Access Memory (RAM)
	P0606 Control Module Internal Performance
	P060B Internal Control Module A/D Processing Performance
	P062F Control Module Long Term Memory Performance
	P0642 Sensor Reference Voltage A Circuit Low
	P06A6 Sensor Reference Voltage "A" Circuit Range/Performance
	U3007 Control Module Input Power "B" Circuit/Open
	U3019 Control Module Input Power Circuit "B/C" Correlation
	U3501 Control Module Input Power "A" Circuit Low
	U3505 Control Module Input Power "B" Circuit Low
	U3509 Control Module Input Power "C" Circuit Low
P0603 Control Module Long Term Memory Reset	
P0604 Control Module Random Access Memory (RAM)	
P0606 Control Module Internal Performance	
P060B Internal Control Module A/D Processing Performance	
P062F Control Module Long Term Memory Performance	
U3501 Control Module Input Power "A" Circuit Low
