Engine Coolant Temp Sensor Circuit High	P0118	Circuit Continuity This DTC detects a short to high or open in the ECT signal circuit or the ECT sensor.	ECT Resistance (@ -60°C)	> 320,000 Ohms	Engine run time OR IAT min	> 10.0 seconds ≥ -7.0 °C	5 failures out of 6 samples 1 sec/ sample Continuous	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
	P0119	Circuit Continuity This DTC detects large step changes in the ECT signal circuit or the ECT sensor. Allowable high and low limits are calculated for the next sample based on the previous sample.	ECT temperature step change: 1) postive step change is greater than calculated high limit OR 2) negitive step change is lower than calculated low limit. The calculated high and low limits for the next reading use the following calibrations: 1) Sensor time constant 2) Sensor low limit 3) Sensor high limit	10.0 seconds -80.0 Deg C 200.0 Deg C	No Active DTC's	ECT_Sensor_Ckt_FP	3 failures out of 4 samples 1 sec/ sample Continuous	
			*****Generic Example***** If the last ECT reading was 90 Deg C, the Time constant was calibrated at 10 seconds, the low limit was calibrated to -80 Deg C and the high limit was calibrated to 200 Deg C the caluculated limits are 101 Deg C and 73 Deg C. The next reading (after the 90 Deg C reading) must be between 73 Deg C and 101 Deg C to be valid.

		This DTC detects if the engine coolant temperature rises too slowly due to an ECT or Cooling system fault	Energy is accumulated after the first conbustion event using Range #1 or #2 below: Thermostat type is divided into normal (non-heated) and electrically heated. For this application the "type" cal (KeTHMG_b_TMS_ElecT hstEquipped) = 0 If the type cal is equal to one, the application has an electrically heated t-stat, if equal to zero the the application has an non heated t-stat. See appropiate section below. ***********************************	See the two tables named: P0128_Maximum Accumulated Energy for Start-up ECT conditions - Primary and P0128_Maximum Accumulated Energy for Start-up ECT conditions - Alternate in the Supporting tables section. O2S Circuit Low Voltage Bank 1 Sensor 1 (For use with WRAF - E80	P0131	This DTC determines if the O2 sensor circuit is shorted to low.	B1S1 WRAF ASIC indicates a ground short on any of the following signals: A) Pump Current - short to ground fail counts are accumulated to determine fault status B) Reference Cell Voltage - short to ground fail counts are accumulated to determine fault status C) Reference Ground - short to ground fail counts are accumulated to determine fault status C) Reference Ground - short to ground fail counts are accumulated to determine fault status Note: This ASIC is referred to as C2WRAF (Delphi). Note: This DTC will detect short to ground faults to the Pump current, Ref Cell voltage and Ref Cell ground circuits. Note: A ground short on the Pump Current or Reference Voltage signal may also set a P223C DTC.	The ASIC provides a fault indication when the pump current pin is between -150 mV and + 175 mV. The ASIC provides a fault indication when the Reference Cell Voltage pin < 225 mV. The ASIC provides a fault indication when during an intrusive event the Reference Cell impedance change is <= 90 ohms. Note: Signal A & B faults must exist for 24 ASIC clock cycles to qualify for a fail flag. The three fault signals have individual X out of Y calibrations. When the X out of Y is reached in any region this DTC is set	B1S1 DTC's Not active this key cycle Measure valid status (ASIC) Controller status (ASIC) Engine Run or Auto stop WRAF Ref cell temperature ***********************************	P0135, P0030, P0031 or P0032 = Valid = Ready = True > = 628 Deg C = Complete > = 20.0 seconds	Signal A: 128 failures out of 160 samples OR Signal B: 128 failures out of 160 samples OR Signal C: 10 failures out of 12 samples Frequency for Signal A & B: Continuous in 25 msec loop Frequency for Signal C: Tested during an intrusive event performed every 60 seconds. During each event the impedance is measured 3 times once every 12.5 msec.	Type B, 2 Trips

O2S Circuit High Voltage Bank 1 Sensor 1 (For use with WRAF - E80	P0132	This DTC determines if the O2 sensor circuit is shorted to high.	B1S1 WRAF ASIC indicates a short to power on any of the following WRAF signals: A) Pump Current - short to power fail counts are accumulated to determine fault status. B) Reference Cell Voltage - short to power fail counts are accumulated to determine fault status. C) Reference Ground - short to power fail counts are accumulated to determine fault status. C) Reference Ground - short to power fail counts are accumulated to determine fault status. Note: This ASIC is referred to as C2WRAF (Delphi). Note: This DTC will detect a short to power fault to the Pump Current (and Trim circuit), Reference Cell Voltage and Reference Ground circuit.	The ASIC provides a fault indication when the pump current pin > 2.8 V. The ASIC provides a fault indication when the Reference Cell Voltage pin > 3.3 V. The ASIC provides a fault indication when the Reference Ground pin > 225 mV. Note: The above faults must exist for 21 ASIC clock cycles to qualify for a fail flag. The three fault signals have individual X out of Y calibrations. When the X out of Y is reached in any region this DTC is set.	B1S1 DTC's Not active this key cycle Measure valid status (ASIC) Controller status (ASIC) Engine Run or Auto stop WRAF Ref cell temperature ***********************************	P0135, P0030, P0031 or P0032 = Valid = Ready = True > = 628 Deg C = Complete > = 20.0 seconds	Signal A: 128 failures out of 160 samples OR Signal B: 128 failures out of 160 samples OR Signal C: 128 failures out of 160 samples Frequency: Continuous in 25 milli - second loop	Type B, 2 Trips

Fuel System Too Rich Bank 1	P0172	Determines if the fuel control system is in a rich condition, based on the filtered longterm fuel trim metric.	Passive Test: The filtered Non-Purge Long Term Fuel Trim metric AND	<= 0.725		Secondary Parameters and Enable Conditions are identical to those for P0171, with the exception that fuel level is not considered.	Frequency: 100 ms Continuous Loop	Type B, 2 Trips
		There are two methods to determine a Rich fault. They are Passive and Intrusive. A Passive Test decision can be made up until the time that purge is	The filtered Short Term Fuel Trim metric (Note: any value above 1.05 effectively nullifies the short-term fuel trim criteria)	<= 2.000		considered.		
		first enabled. From that point forward, rich faults can only be detected by turning purge off intrusively.	Intrusive Test: For 3 out of 5 intrusive segments, the filtered Purge Long Term Fuel Trim metric	<= 0.730				
		Intrusive Test: If the filtered Purge Long Term Fuel Trim metric > 0.730, the test passes without intrusively checking the filtered Non-Purge Long Term Fuel Trim	AND The filtered Non-Purge Long Term Fuel Trim metric AND	<= 0.725				
		metric. However if the filtered Purge Long Term Fuel Trim metric is <= 0.730, purge is ramped off to determine if excess purge vapor is the cause of the rich	The filtered Short Term Fuel Trim metric (Note: any value above 1.05 effectively nullifies the short-term fuel trim criteria)	<= 2.000				
		condition. Performing intrusive tests too frequently may also affect EVAP and EPAIII emissions,	Segment Def'n: Segments can last up to 42 seconds and are separated by the lesser of 10.0 seconds of purge-on time or enough time to					

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
		and the execution frequency of other diagnostics.	purge 10 grams of vapor. A maximum of 5 completed segments or 15 attempts are allowed for each intrusive test. After an intrusive test report is completed, another intrusive test cannot occur for 300 seconds to allow sufficient time to purge excess vapors from the canister. During this period, fuel trim will pass if the filtered Purge Long Term Fuel Trim metric > 0.730 for at least 120.0 seconds, indicating that the canister has been purged.

Random Misfire Detected Cylinder 1 Misfire Detected Cylinder 2 Misfire Detected Cylinder 3 Misfire Detected Cylinder 4 Misfire Detected	P0300 P0301 P0302 P0303 P0304	These DTC's will determine if a random or a cylinder specific misfire is occurring by monitoring various terms derived from crankshaft velocity. The pattern of misfire is taken into account to select the proper misfire thesholds Additionally, the pattern of crankshaft acceleration after the misfire is checked to differentiate between real misfire and other sources of crank shaft noise such as rough road. The rate of misfire over an interval is compared to both emissions and catalyst damaging thresholds.	Crankshaft Deceleration Value(s) vs. Engine Speed and Engine load The equation used to calculate deceleration value is tailored to specific vehicle operating conditions. The selection of the equation used is based on the 1st single cylinder continuous misfire threshold tables encountered that are not max of range. If all tables are max of range at a given speed/load, that speed load region is an Undetectable region see Algorithm Description Document for additional details. SINGLE CYLINDER CONTINUOUS MISFIRE(- see details of thresholds on Supporting Tables Tab > IdleSCD_Decel AND > IdleSCD_Jerk) > SCD_Decel AND > SCD_Jerk) > IdleCyl_Decel AND > IdleCyl_Decel AND > IdleCyl_Jerk) > CylModeDecel AND > CylModeJerk)	Engine Run Time Engine Coolant Temp Or If ECT at startup Then ECT System Voltage + Throttle delta - Throttle delta - Throttle delta Early Termination option: (used on plug ins that may not have enough engine run time at end of trip for normal interval to complete.)	> 2 crankshaft revolution -7°C < ECT < 130°C < -7°C 21°C < ECT < 130°C 9.00 < volts < 32.00 < 95.00 % per 25 ms < 95.00 % per 25 ms Not Enabled	Emission Exceedence = any (5) failed 200 rev blocks out of (16) 200 rev block tests Failure reported for (1) Exceedence in 1st (16) 200 rev block tests, or (4) Exceedences thereafter. 					MISFIRE CRANKSHAFT PATTERN RECOGNITION checks each "misfire" candidate in 100 engine Cycle test to see if overall crankshaft pattern looks like real misfire (recognized), or some disturbance like rough road (unrecognized).			

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
					At the end of 100 engine cycle test, the ratio of unrecog/recognized is checked to confirm if real misfire is present within the 100 engine cycles. Typically used for checking a single misfire per engine cycle but can support some other patterns on some packages Pattern Recog Enabled:	Enabled		
					Pattern Recog Enabled during Cylinder Deac	Not Enabled		
					Pattern Recog Enabled consecutive cyl pattrn	Enabled		
					Engine Speed Veh Speed	900 < rpm < 6,500 > 3.1 mph		
					The 1st check for "recognized" is the 1st fired cylinder after the misfire candidate should both accelerate and jerk an amount based acceleration and jerk of Single Cylinder Misfire thresholds in effect at that speed and load.			
					(CylAfter_Accel AND CylAfter_Jerk)	> Misfire_ decel * 1st_FireAftrMisfr_Acel > Misfire_Jerk *		
					, - ,	1st_FireAftrMisfr_Jerk		

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
					Addtionally, the crankhaft is checked again a small calibratible number of cylinders later to see if the distrubance is still large like rough road, or has calmed down like real misfire. The size of disturbance is compared to a multiplier times the ddt_jerk value used to detect misfire at that speed and load. If there is repetitive misfire on consecutive engine cycles, the expected snap is adjusted due to the higher expected disturbance.			
					Num of Cylinders after misfire to start check of crankshaft snap	2 Cylinders		
					"misfire" recognized if: Crankshaft snap after: isolated "misfire"	< Misfire_Jerk * SnapDecayAfterMisfire		
					repetative "misfire"	< Misfire_Jerk * SnapDecayAfterMisfire * RepetSnapDecayAdjst in Supporting Tables	discard 100 engine cycle test	
					At the end of 100 engine cycle test, the ratio of unrecog/recognized is checked to confirm if real misfire is present.			
					Ratio of Unrecog/Recog	> 0.80

Catalyst System Low Efficiency Bank 1	P0420	NOTE: The information below applies to applications that use the Decel Catalyst Monitor Algorithm Oxygen Storage. The catalyst washcoat contains Cerium Oxide. Cerium Oxide reacts with NO and O2 during lean A/F excursions to store the excess oxygen (I.e. Cerium Oxidation). During rich A/F excursions, Cerium Oxide reacts with CO and H2 to release this stored oxygen (I.e. Cerium Reduction). This is referred to as the Oxygen Storage Capacity, or OSC. CatMon's strategy is to "measure" the OSC of the catalyst through forced Rich (intrusive rich) and Lean (decel fuel cutoff) A/F excursions Normalized Ratio OSC Value Calculation Information and Definitions = 1. Raw OSC Calculation = (post cat O2 Resp time) 2. BestFailing OSC value from a calibration	Normalized Ratio OSC Value (EWMA filtered)	< 0.35	All enable criteria associated with P0420 can be found under P2270 - (O2 Sensor Signal Stuck Lean Bank 1 Sensor 2) Rapid Step Response (RSR) feature will initiate multiple tests: If the difference between current EWMA value and the current OSC Normalized Ratio value is and the current OSC Normalized Ratio value is Maximum number of RSR tests to detect failure when RSR is enabled. Front O2 Sensor or Front WRAF Rear O2 Sensor General Enable Criteria In addition to the p-codes listed under P2270, the following DTC's shall also not be set: For switching O2 sensors:	> 0.63 < 0.18 12 > 825.00 mV or > 1.08 EQR > 825.00 mV O2S_Bank_1_Sensor_1_ FA	1 test attempted per valid decel period Minimum of 1 test per trip Maximum of 4 tests per trip Frequency: Fueling Related: 12.5 ms OSC Measurements: 100 ms Temp Prediction: 12.5ms	Type A, 1 Trips

Evaporative Emission (EVAP) System Small Leak Detected (No ELCP - Conventional EVAP Diagnostic with EAT using OAT Sensor)	P0442	This DTC will detect a small leak (≥ 0.020") in the EVAP system between the fuel fill cap and the purge solenoid. On some applications a small leak is defined as ≥ 0.025", 0.030", or 0.150". The engine off natural vacuum method (EONV) is used. EONV is an evaporative system leak detection diagnostic that runs when the vehicle is shut off when enable conditions are met. Prior to sealing the system and performing the diagnostic, the fuel volatility is analyzed. In an open system (Canister Vent Solenoid [CVS] open) high volatility fuel creates enough flow to generate a measurable pressure differential relative to atmospheric.After the volatility check, the vent solenoid will close. After the vent is closed, typically a build up of pressure from the hot soak begins (phase-1). The pressure typically will peak and then begin to decrease as the fuel cools. When	The total delta from peak pressure to peak vacuum during the test is normalized against a calibration pressure threshold table that is based upon fuel level and ambient temperature. (Please see P0442 EONV Pressure Threshold (Pascals) Table in Supporting Tables). The normalized value is calculated by the following equation: 1 - (peak pressure - peak vacuum) / pressure threshold. The normalized value is entered into EWMA (with 0= perfect pass and 1= perfect fail). When EWMA is the DTC light can be turned off if the EWMA is and stays below the EWMA fail threshold for 3 additional consecutive trips.	> 0.56 (EWMA Fail Threshold), ≤ 0.35 (EWMA Re- Pass Threshold)	Fuel Level Drive Time Drive length ECT Baro Distance since assembly plant Engine not run time before key off must be Time since last complete test if normalized result and EWMA is passing OR Time since last complete test if normalized result or EWMA is failing Estimated Ambient Temperature (EAT) using OAT sensor at end of drive Conditions for Estimated Ambient Temperature Using OAT Sensor to be Valid ************************************	10 % ≤ Percent ≤ 90 % ≥ 600 seconds ≥ 5.0 miles ≥ 63 °C ≥ 70 kPa ≥ 10.0 miles ≤ refer to P0442 Engine Off Time Before Vehicle Off Maximum as a Function of Estimated Ambient Temperature Table in Supporting Tables. ≥ 17 hours ≥ 10 hours ○ °C≤Temperature≤ 34 °C	Once per trip, during hot soak (up to 2,400 sec.). No more than 2 unsuccessful attempts between completed tests. Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Fuel Tank Pressure (FTP) Sensor Circuit Performance (No ELCP - Conventional EVAP Diagnostic)	P0451	The DTC will be set if the fuel tank vacuum sensor is out of range when it tries to re-zero prior to the phase-1 or phase-2 portions of the engine-off natural vacuum small leak test.	The tank vacuum sensor voltage is compared to a window about the nominal sensor voltage offset (~1.5 volts) Upper voltage threshold (voltage addition above the nominal voltage) Lower voltage threshold (voltage subtraction below the nominal voltage) The difference between tank vacuum sensor voltage and the nominal offset voltage is then normalized against the appropriate threshold listed above to produce a ratio between 0.0 and 1.0. This normalized re-zero ratio is then filtered with a EWMA (with 0= perfect pass and 1=perfect fail).	0.2 volts 0.2 volts	This test will execute whenever the engine-off natural vacuum small leak test (P0442) executes		This test is executed during an engine-off natural vacuum small leak test. The number of times that it executes can range from zero to two per engine-off period. The length of the test is determined by the refueling rationality test, which can take up to 600 seconds to complete.	Type A, 1 Trips EWMA Average run length: 6 Run length is 2 trips after code clear or non- volatile reset
			When EWMA is the DTC light is illuminated.	> 0.73 (EWMA Fail Threshold),				
			The DTC light can be turned off if the EWMA is and stays below the EWMA fail threshold for 3 additional consecutive trips.	≤0.40 (EWMA Re-Pass Threshold)				

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Fuel Tank Pressure (FTP) Sensor Circuit Low Voltage (No ELCP - Conventional EVAP Diagnostic)	P0452	This DTC will detect a Fuel Tank Pressure (FTP) sensor signal that is too low out of range.	The normal operating range of the FTP sensor is 0.5 volts (~1245 Pa) to 4.5 volts (~-3736 Pa).	< 0.15 volts (3.0 % of Vref or ~ 1,681 Pa)	Time delay after sensor power up for sensor warm-up is	0.10 seconds	640 failures out of 800 samples 12.5 ms / sample	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Fuel Tank Pressure (FTP) Sensor Circuit High Voltage (No ELCP - Conventional EVAP Diagnostic)	P0453	This DTC will detect a Fuel Tank Pressure (FTP) sensor signal that is too high out of range.	The normal operating range of the FTP sensor is 0.5 volts (~1245 Pa) to 4.5 volts (~-3736 Pa).	> 4.85 volts (97.0 % of Vref or ~ -4,172 Pa)	Time delay after sensor power up for sensor warm-up is	0.10 seconds	640 failures out of 800 samples 12.5 ms / sample	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Fuel Tank Pressure (FTP) Sensor Circuit Intermittent (No ELCP - Conventional EVAP Diagnostic)	P0454	This DTC will detect intermittent tank vacuum sensor signals that would have caused the engine-off natural vacuum small leak test to abort due to an apparent re-fueling event.	If an abrupt change in tank vacuum is detected the engine-off natural vacuum test is aborted due to an apparent refueling event. Subsequent to the abort, a refueling rationality test is executed to confirm that a refueling event occurred. If a refueling is confirmed, then the test sample is considered passing. Otherwise, the sample is considered failing indicating an intermittent signal problem. An abrupt change is defined as a change in vacuum: in the span of 1.0 seconds. But in 12.5 msec. A refueling event is confirmed if the fuel level has a persistent change of for 30 seconds during a 600 second refueling rationality test.	> 112 Pa < 249 Pa > 10 %	This test will execute whenever the engine-off natural vacuum small leak test (P0442) executes and the canister vent solenoid is closed		This test is executed during an engine-off natural vacuum small leak test. The test can only execute up to once per engine-off period. The length of the test is determined by the refueling rationality test, which can take up to 600 seconds to complete. The test will report a failure if 2 out of 3 samples are failures. 12.5 ms / sample	Type A, 1 Trips

Engine Oil Pressure (EOP) Sensor Circuit High Voltage	P0523	Determines if the Engine Oil Pressure (EOP) Sensor circuit voltage is too high	(Engine Oil Pressure Sensor Circuit Voltage) ÷ 5 Volts) *100	> 95.00 percent	Oil Pressure Sensor In Use Diagnostic Status	Yes	800 failures out of 1,000 samples Performed every 6.25 msec	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Brake Booster Pressure Sensor Performance	P0556	Determines if the Brake Booster Vacuum Sensor is stuck or skewed within the normal operating range by comparing the engine vacuum to the brake booster vacuum when the engine is producing a large amount of vacuum	Engine vs brake booster vacuum sensor values are compared when % throttle < value for a time period. When throttle once again > calibrated value, min and max vacuum sensor values are normalized and subtracted from a 1st order lag filter value of 1. A properly operating vacuum sensor would have a normalized result of 1 or greater. If the normalized result is greater than 1 it is considered 1. The 1st order lag filter value would be 0 in a passing system. 1st order lag re-pass threshold		Throttle Area (with idle included) for time period of BrkBoostVacDiff For time period of AND Vacuum Delta Diagnostic enabled/ disabled No active DTC's	<= 5.0 Percent for > 3.0 seconds > 0.3 kPa >= 0.2 Seconds >= 6.0 kPa 1.00 Fault bundles: MAP_SensorFA TPS_FA BrakeBoosterSensorCktF A	Pass counter incremented when enable conditions are met, pass achieved when counter >= 7 Performed every 100 msec	Type B, 2 Trips

Cold Start Emissions Reduction System Fault	P1400	Model based test computes power from exhaust flow and thermal energy resulting from elevated idle speed and retarded spark advance. Detects if the cold start emission reduction system has failed resulting in the delivered power being out of range.	Average desired accumulated exhaust power - Average actual accumulated exhaust power (too much energy delivered to catalyst) Average desired accumulated exhaust power - Average actual accumulated exhaust power (too little energy delivered to catalyst) (EWMA filtered) Average Power = output of P1400_EngineSpeedRes idual_Table * output of P1400_SparkResidual_T able NOTE: Desired accumulated power would use the desired catalyst light off spark and desired engine speed and the actual accumuated power would use the final commanded spark and actual engine speed. Refer to the Supporting Tables for details	< -32.00 KJ/s (high RPM failure mode) > 4.00 KJ/s (low RPM failure mode)	To enable the diagnostic, the Cold Start Emission Reduction Strategy must be Active per the following: Catalyst Temperature AND Engine Coolant AND Engine Coolant AND Barometric Pressure The Cold Start Emission Reduction strategy must not be exiting. The strategy will exit per the following: Catalyst Temperature AND Engine Run Time OR Engine Run Time OR Barometric Pressure	< 300.00 degC > -12.00 degC <= 56.00 degC >= 78.00 KPa >= 800.00 degC >= 22.00 seconds > P050D_P1400_CatalystLightOffExtendedEngine RunTimeExit This Extended Engine run time exit is a function of percent ethanol and Catmons NormRatioEWMA. Refer to "Supporting Tables" for details. < 78.00 KPa	Runs once per trip when the cold start emission reduction strategy is active Frequency: 100ms Loop Test completes after 8 seconds of accumulated qualified data.	EWMA Based - Type A, 1 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
					Other Enable Criteria:			
					OBD Manufacturer Enable Counter	0		
					Vehicle Speed	< 1.86 MPH		
					Allow diagnostic to calculate residual in an off-idle state. If the value of the OffIdleEnable is equal to 1 then the "DriverOffAccelPedal" will not be checked. However, if the value of OffIdleEnable is 0 then driver must be off the accel pedal	0 (A value of 1 allows diagnostic to run and calculate the residual while off idle. A value of 0 requires calculation of the residual at idle)		
					A change in throttle position (tip-in/tip-out) will initiate a delay in the calculation of the average qualified residual value. Therefore when the:			
					Pedal Close Delay Timer	> 5.00 seconds		
					the diagnostic will continue the calculation.			
					A change in gear will initiate a delay in the calculation of the average qualified residual value to			

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
					allow time for the actual engine speed and actual final commanded spark to achieve their desired values. Therefore, when the:			
					Gear Shift Delay Timer	> 1.50 seconds		
					the diagnostic will continue the calculation			
					For Manual Transmission vehicles:			
					Clutch Pedal Position	> 88.00%		
					Clutch Pedal Position	< 16.00 %		
					The diagnostic will delay calculation of the residual value and potentially weight the residual calculation differently based on engine run time. This is to ensure the diagnostic is operating in idle speed control as well as during the peak catalyst light off period. The time weighting factor must be:	> 0 These are scalar values that are a function of engine run time. Refer to

Post Catalyst Fuel Trim System Low Limit Bank 1 (Too Rich)	P2096	Determines if the post catalyst O2 sensor based fuel control system has utilized all or most of it's low limit authority, indicating a rich exhaust gas condition. Note: If the post catalyst O2 voltage is too rich, the post catalyst O2 integral offset control is decreased. This results in lean bias fuel control in an attempt to correct the rich condition. A perfectly balanced control system (no rich or lean bias required) is represented by an integral offset value of "0" and a post catalyst O2 sensor that is within it's optimal operating range (neither rich nor lean). An integral offset value < 0 is indicative of the control system reacting to a rich post catalyst O2 sensor. If the failure is such that the control system utilizes all or most of its available authority, then P2096 will set.	Rich Fail counter High Vapor Feature: The diagnostic is at risk of reporting a false fail when excessively High Vapor (HV) conditions are present. This HV condition is indicated when the purge valve is open AND percent vapor is >= 18 % for >= 5.0 seconds. Diagnosis resumes if the purge valve is closed OR the percent vapor is <= 14 % for >= 5.0 seconds. This was done to minimize disabling the diagnostic for longer than necessary.	>= 300 counts per 800 sample counts Note: Counters increment at a rate of 10 per second when enable conditions are met. If the fail count threshold is reached, a fail is reported and the diagnostic will not report again until the next trip. If the sample count threshold is reached before a fail is reported, a pass is reported, the counters are reset to 0, and evaluation starts again. Control Module Power Off Timer Performance	P262B	This DTC determines if the hardware timer does not initialize or count properly. There are two tests to ensure proper functioning of the timer: Count Up Test (CUT) and Range Test (RaTe). Count Up Test (CUT): Verifies that the HWIO timer is counting up with the proper increment.	Count Up Test: Time difference between the current read and the previous read of the timer	> 1.50 seconds			Count Up Test: 4 failures out of 20 samples 1 sec / sample Continuous while run/crank is not active and until controller shutdown is initiated.	Type B, 2 Trips
		Range Test (RaTe): When the run/crank is not active both the hardware and mirror timers are started. The timers are compared when module shutdown is initiated or run/crank becomes active.	Range Test: The variation of the HWIO timer and mirror timer is	> 0.25 %.			Range Test: Once per trip when controller shutdown is initiated or run/ crank becomes active.

Manifold Absolute Pressure Sensor Circuit Low	P0107	Detects a continuous short to low or open in either the signal circuit or the MAP sensor.	MAP Voltage	< 3.0 % of 5 Volt Range (This is equal to 0.15 Volts or 3.5 kPa)	Continuous		320 failures out of 400 samples 1 sample every 12.5 msec	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Manifold Absolute Pressure Sensor Circuit High	P0108	Detects an open sensor ground or continuous short to high in either the signal circuit or the MAP sensor.	MAP Voltage	> 90.0 % of 5 Volt Range (This is equal to 4.50 Volts, or 115.0 kPa)	Continuous		320 failures out of 400 samples 1 sample every 12.5 msec	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Injector 1 Open Circuit - (PFI)	P0201	This DTC Diagnoses Injector 1 low side driver circuit for circuit faults.	Voltage low during driver off state indicates short-to-ground or open circuit	Open circuit: ≥ 200 KΩ impedance between signal and controller ground	Powertrain Relay Voltage within range for a duration Engine Running	>= 11 Volts >= 1 Seconds >= 0 Seconds	20 failures out of 25 samples 100 ms /sample Continuous	Type B, 2 Trips Note: In certain controlle rs P0261 may also set (Injector 1 Short to Ground)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Injector 2 Open Circuit - (PFI)	P0202	This DTC Diagnoses Injector 2 low side driver circuit for circuit faults.	Voltage low during driver off state indicates short-to-ground or open circuit	Open circuit: ≥ 200 KΩ impedance between signal and controller ground	Powertrain Relay Voltage within range for a duration Engine Running	>= 11 Volts >= 1 Seconds >= 0 Seconds	failures out of 25 samples 100 ms /sample Continuous	Type B, 2 Trips Note: In certain controlle rs P0264 may also set (Injector 2 Short to Ground)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Injector 3 Open Circuit - (PFI)	P0203	This DTC Diagnoses Injector 3 low side driver circuit for circuit faults.	Voltage low during driver off state indicates short-to-ground or open circuit	Open circuit: ≥ 200 KΩ impedance between signal and controller ground	Powertrain Relay Voltage within range for a duration Engine Running	>= 11 Volts >= 1 Seconds >= 0 Seconds	failures out of 25 samples 100 ms /sample Continuous	Type B, 2 Trips Note: In certain controlle rs P0267 may also set (Injector 3 Short to Ground)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Injector 4 Open Circuit - (PFI)	P0204	This DTC Diagnoses Injector 4 low side driver circuit for circuit faults.	Voltage low during driver off state indicates short-to-ground or open circuit	Open circuit: ≥ 200 KΩ impedance between signal and controller ground	Powertrain Relay Voltage within range for a duration Engine Running	>= 11 Volts >= 1 Seconds >= 0 Seconds	20 failures out of 25 samples 100 ms /sample Continuous	Type B, 2 Trips Note: In certain controlle rs P0270 may also set (Injector 4 Short to Ground)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Injector 1 Low side circuit shorted to ground (PFI)	P0261	This DTC Diagnoses Injector 1 low side driver circuit for circuit faults.	Voltage low during driver off state indicates short-to-ground or open circuit	Short to ground: ≤ 0.5 Ω impedance between signal and controller ground	Powertrain Relay Voltage within range for a duration Engine Running	>= 11 Volts >= 1 Seconds >= 0 Seconds	20 failures out of 25 samples 100 ms /sample Continuous	Type B, 2 Trips Note: In certain controlle rs P0201 may also set (Injector 1 Open Circuit)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Injector 1 Low side circuit shorted to power (PFI)	P0262	This DTC Diagnoses Injector 1 low side driver circuit for circuit faults.	on state indicates short to	Short to power: ≤ 0.5 Ω impedance between signal and controller power	Powertrain Relay Voltage within range for a duration Engine Running		failures out of 25 samples 100 ms /sample Continuous	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Injector 2 Low side circuit shorted to ground (PFI)	P0264	This DTC Diagnoses Injector 2 low side driver circuit for circuit faults.	Voltage low during driver off state indicates short-to-ground or open circuit	Short to ground: ≤ 0.5 Ω impedance between signal and controller ground	Powertrain Relay Voltage within range for a duration Engine Running	>= 11 Volts >= 1 Seconds >= 0 Seconds	20 failures out of 25 samples 100 ms /sample Continuous	Type B, 2 Trips Note: In certain controlle rs P0202 may also set (Injector 2 Open Circuit)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Injector 2 Low side circuit shorted to power (PFI)	P0265	This DTC Diagnoses Injector 2 low side driver circuit for circuit faults.	on state indicates short to	Short to power: ≤ 0.5 Ω impedance between signal and controller power	Powertrain Relay Voltage within range for a duration Engine Running		failures out of 25 samples 100 ms /sample Continuous	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Injector 3 Low side circuit shorted to ground (PFI)	P0267	This DTC Diagnoses Injector 3 low side driver circuit for circuit faults.	Voltage low during driver off state indicates short-to-ground or open circuit	Short to ground: ≤ 0.5 Ω impedance between signal and controller ground	Powertrain Relay Voltage within range for a duration Engine Running	>= 11 Volts >= 1 Seconds >= 0 Seconds	20 failures out of 25 samples 100 ms /sample Continuous	Type B, 2 Trips Note: In certain controlle rs P0203 may also set (Injector 3 Open Circuit)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions		MIL Illum.
Injector 3 Low side circuit shorted to power (PFI)	P0268	This DTC Diagnoses Injector 3 low side driver circuit for circuit faults.	on state indicates short to	Short to power: ≤ 0.5 Ω impedance between signal and controller power	Powertrain Relay Voltage within range for a duration Engine Running		failures out of 25 samples 100 ms /sample Continuous	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Injector 4 Low side circuit shorted to ground (PFI)	P0270	This DTC Diagnoses Injector 4 low side driver circuit for circuit faults.	Voltage low during driver off state indicates short- to-ground or open circuit	Short to ground: ≤ 0.5 Ω impedance between signal and controller ground	Powertrain Relay Voltage within range for a duration Engine Running	>= 11 Volts >= 1 Seconds >= 0 Seconds	20 failures out of 25 samples 100 ms /sample Continuous	Type B, 2 Trips Note: In certain controlle rs P0204 may also set (Injector 4 Open Circuit)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Injector 4 Low side circuit shorted to power (PFI)	P0271	This DTC Diagnoses Injector 4 low side driver circuit for circuit faults.	on state indicates short to	Short to power: ≤ 0.5 Ω impedance between signal and controller power	Powertrain Relay Voltage within range for a duration Engine Running		failures out of 25 samples 100 ms /sample Continuous	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Secondary AIR Incorrect Airflow (for single valve systems)	P0411	Detects an insufficient flow condition. This test is run during Phase 1 (AIR pump commanded On, Valve commanded Open). Leaks downstream of the valve are detected via an evaluation of average pressure error and average "String Length" (SL) — a term that represents the absolute pressure delta accumulated every 6.25ms, then averaged over the duration of the test. Low SL values are indicative of downstream leaks or blockages.	Average Pressure Error or OR the following String Length (SL) Test: Average Pressure Error or and the Average String Length NOTE: Average Pressure Error is the average difference between the predicted pressure and the measured pressure	> 5.0 kPa < -4.9 kPa > 1.0 kPa < -1.0 kPa P0411 SL Threshold < Bank 1 Table	BARO Inlet Air Temp Coolant Temp Engine off time System Voltage MAP not Engine Speed MAF not SL Stability time SL RPM range No active DTCs:	> 60 kPa > -10.0 deg C > -10.0 deg C < 80.0 > 3,600.0 seconds > 10.0 Volts < 32.0 < 20 kPa for 2.0 sec < 5,000 RPM > 50 gm/s for 3.0 sec > 5.0 seconds Bank 1 > 5.0 seconds Bank 2 < 6,000 RPM or > 6,500 AIRSystemPressureSens or FA AIRValveControlCircuit FA AIRPumpControlCircuit FA AMF_SensorFA ECT_SensorFA ECT_SensorFA ECT_SensorFA CatalystSysEfficiencyLoB 1_FA CatalystSysEfficiencyLoB 2_FA P0606 IgnitionOutputDriver_FA FuelInjectorCircuit_FA	Phase 1 Conditional test weight > 7.0 seconds Total 'String Length' accumulation time: > 10.0 sec Bank1 > 10.0 sec Bank2 Frequency: Once per trip when AIR pump commanded On Conditional test weight is calculated by multiplying the following Factors: P0411 Phase 1 Baro Test Weight Factor, P0411 Phase 1 MAF Test Weight Factor, P0411 Phase 1 System Volt Test Weight Factor , P0411 Phase 1 Amb Temp Test Weight Factor (see Supporting Tables)	Type B, 2 Trips

Secondary AIR Solenoid Control Circuit Open	P0412	Diagnoses the Secondary AIR Solenoid Control Low Side Driver circuit for circuit faults	Voltage low during driver off state (indicates open circuit)	Open Circuit: >= 200K Ohms impedance between signal and controller ground	Powertrain Relay Voltage	>=11.00 volts	20 failures out of 25 samples 250ms / sample	Type B, 2 Trips Note: In certain controlle rs P041F may also set (Second ary AIR solenoid control circuit low voltage)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Secondary AIR Pump Control Circuit Open	P0418	Diagnoses the Secondary AIR Pump Control Low Side Driver circuit for circuit faults	Voltage low during driver off state (indicates open circuit)	Open Circuit: >= 200K Ohms impedance between signal and controller ground	Powertrain relay Voltage	>= 11.00 volts	20 failures out of 25 samples 250ms / sample	Type B, 2 Trips Note: In certain controlle rs P2257 may also set (Second ary AIR Pump Control Circuit Low Voltage)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Secondary AIR Solenoid Control Circuit Low Voltage	P041F	Diagnoses the Secondary AIR Solenoid Control Low Side Driver circuit for circuit faults	Voltage low during driver off state (indicates short-to-ground)	Short to ground: <= 0.5 Ohms impedance between signal and controller ground	Powertrain relay Voltage	>= 11.00 volts	20 failures out of 25 samples 250ms / sample	Type B, 2 Trips Note: In certain controlle rs P0412 may also set (Second ary AIR solenoid control circuit Open)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Secondary AIR Solenoid Control Circuit High Voltage	P044F	Diagnoses the Secondary AIR Solenoid Control Low Side Driver circuit for circuit faults	Voltage high during driver on state (indicates short- to-power)	Short to power: <= 0.5 Ohms impedance between signal and controller power	Powertrain relay Voltage	>= 11.00 volts	20 failures out of 25 samples 250ms / sample	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Cooling Fan 2 Relay Control Circuit Open (ODM)	P0481	Diagnoses the cooling fan 2 relay control low side driver circuit for circuit faults	Voltage low during driver off state (indicates open circuit)	Open Circuit: ≥ 200 K Ω impedance between signal and controller ground	Powertrain Relay Voltage	Voltage ≥ 11.00 volts	50 failures out of 63 samples 100 ms / sample	Type B, 2 Trips Note: In certain controlle rs P0693 may also set (Fan 2 Short to Ground)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Intake Manifold Tuning (IMT) Valve Solenoid Control Circuit Bank 1	P0660	Diagnoses the Intake Manifold Tuning (IMT) Valve low side driver circuit for circuit faults	Voltage low during driver off state (indicates open circuit)	Open Circuit: >= 200K Ohms impedance between signal and controller ground	Powertrain Relay Voltage Engine Speed	>= 11.00 Volts >= 400 RPM	40 failures out of 50 samples 1 sample every 12.5 msec	Type B, 2 Trips Note in certain controlle rs P0661 may also set (Intake Manifold Tuning (IMT) Valve Solenoid Control Circuit Low Voltage Bank 1)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Intake Manifold Tuning (IMT) Valve Solenoid Control Circuit Low Voltage Bank 1	P0661	Diagnoses the Intake Manifold Tuning (IMT) Valve low side driver circuit for circuit faults	Voltage low during driver off state (indicates short-to-ground or open circuit)	Short to ground: <= 0.5 Ohms impedance between signal and controller ground Open Circuit: >= 200K Ohms impedance between signal and controller ground	Powertrain Relay Voltage Engine Speed	>= 11.00 Volts >= 400 RPM	40 failures out of 50 samples 1 sample every 12.5 msec	Type B, 2 Trips Note in certain controlle rs P0660 may also set (Intake Manifold Tuning (IMT) Valve Solenoid Control Circuit Bank 1)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Intake Manifold Tuning (IMT) Valve Solenoid Control Circuit High Voltage Bank 1	P0662	Diagnoses the Intake Manifold Tuning (IMT) Valve low side driver circuit for circuit faults	Voltage low during driver on state (indicates short- to-power)	Short to power: <= 0.5 Ohms impedance between signal and controller power	Powertrain Relay Voltage Engine Speed	>= 11.00 Volts >= 400 RPM	40 failures out of 50 samples 1 sample every 12.5 msec	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Cooling Fan 2 Relay Control Circuit Low Voltage (ODM)	P0693	Diagnoses cooling fan 2 relay control low side driver circuit for circuit faults	Voltage low during driver off state (indicates short- to-ground)	Short to ground: ≤ 0.5 Ω impedance between signal and controller ground	Powertrain Relay Voltage	Voltage ≥ 11.00 volts	50 failures out of 63 samples 100 ms / sample	Type B, 2 Trips Note: In certain controlle rs P0481 may also set (Fan 2 Open Circuit).

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions		MIL Illum.
Cooling Fan 2 Relay Control Circuit High Voltage (ODM)	P0694	Diagnoses the cooling fan 2 relay control low side driver circuit for circuit faults		Short to power: ≤ 0.5 Ω impedance between signal and controller power	Powertrain Relay Voltage	Voltage ≥ 11.00 volts	50 failures out of 63 samples 100 ms / sample	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Intake Manifold Tuning (IMT) Valve Stuck Open	P2070	Detects an Intake Manifold Tuning Valve that is stuck in the open position	Time after the close command without the Intake Manifold Tuning Valve reaching the closed position	>= 5.00 seconds	Intake Manifold Tuning Valve is commanded closed No Active DTCs:	P0660 P0661 P0662 P2077 P2078	320 failures out of 400 samples 1 sample every 12.5 msec	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Intake Manifold Tuning (IMT) Valve Stuck Closed	P2071	Detects an Intake Manifold Tuning Valve that is stuck in the closed position	Time after the open command without the Intake Manifold Tuning Valve reaching the open position	>= 5.00 seconds	Intake Manifold Tuning Valve is commanded closed No Active DTCs:	P0660 P0661 P0662 P2077 P2078	320 failures out of 400 samples 1 sample every 12.5 msec	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Intake Manifold Tuning (IMT) Valve Position Sensor/ Switch Circuit Range/ Performance	P2076	Detects an Intake Manifold Tuning Valve Actuator that has initiated its learn sequence for too long a period of time, or too many times per ignition cycle	Valve Position AND Valve Position for a time period OR Valve Position AND Valve Position for a time period for	>= 5.0 % <= 35.0 % >= 5.0 seconds >= 5.0 % <= 35.0 % >= 0.2 seconds >= 10 times in one ignition cycle	Powertrain Relay Voltage Powertrain Relay Voltage Engine Run Time	>= 11.00 Volts <= 999.00 Volts >= 1.0 seconds	Executes every 12.5 msec	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Intake Manifold Tuning (IMT) Valve Position Sensor/ Switch Circuit Low	P2077	Detects a continuous open or short to low in the Intake Manifold Tuning Valve Position Sensor circuit	Valve Position	>= 95.0 %	Continuous		320 failures out of 400 samples 1 sample every 12.5 msec	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Intake Manifold Tuning (IMT) Valve Position Sensor/ Switch Circuit High	P2078	Detects a continuous short to high in the Intake Manifold Tuning Valve Position Sensor circuit	Valve Position	<= 5.0 %	Continuous		320 failures out of 400 samples 1 sample every 12.5 msec	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Barometric Pressure (BARO) Sensor Circuit Low (non- boosted applications)	P2228	Detects a continuous short to low or open in either the signal circuit or the BARO sensor.	BARO Voltage	< 40.0 % of 5 Volt Range (2.0 Volts = 50.9 kPa)			320 failures out of 400 samples 1 sample every 12.5 msec	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Barometric Pressure (BARO) Sensor Circuit High (non- boosted applications)	P2229	Detects an open sensor ground or continuous short to high in either the signal circuit or the BARO sensor.	BARO Voltage	> 90.0 % of 5 Volt Range (4.5 Volts = 115.0 kPa)			320 failures out of 400 samples 1 sample every 12.5 msec	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Secondary AIR Pump Control Circuit Low Voltage	P2257	Diagnoses the Secondary AIR Pump Control Low Side Driver circuit for circuit faults	Voltage low during driver off state (indicates short-to-ground)	Short to ground: <= 0.5 Ohms impedance between signal and controller ground	Powertrain relay Voltage	>= 11.00 volts	20 failures out of 25 samples 250ms / sample	Type B, 2 Trips Note: In certain controlle rs P0418 may also set (Second ary AIR Pump Control Circuit Open)

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Secondary AIR Pump Control Circuit High Voltage	P2258	Diagnoses the Secondary AIR Pump Control Low Side Driver circuit for circuit faults	Voltage high during driver on state (indicates short- to-power)	Short to power: <= 0.5 Ohms impedance between signal and controller power	Powertrain relay Voltage	>= 11.00 volts	20 failures out of 25 samples 250ms / sample	Type B, 2 Trips

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Secondary AIR System Pressure Sensor Circuit Bank 1	P2430	This DTC detects a stuck in range pressure sensor signal when the AIR pump is commanded on.	Average Pressure Error AND Signal Variation	< 0.50 kPa	BARO Inlet Air Temp Coolant Temp Engine off time System Voltage MAP not Engine Speed MAF not No active DTCs:	> 60 kPa > -10.0 deg C > -10.0 deg C < 80.0 > 3,600.0 seconds > 10.0 Volts < 32.0 < 20 kPa for 2.0 sec < 5,000 RPM > 50 gm/s for 3.0 sec AIRValveControlCircuit FA AIRPumpControlCircuit FA P2432 P2437 P2433 P2438 P0606	Stuck in range cumulative time > 5.0 seconds Frequency: Once per trip when SAI pump is commanded On	Type B, 2 Trips

Stop-Start Capacitor Control	P108D	Indicates that one or more of the following faults have occurred:	DCDC does not stop charging when requsted		No active DTCs	U135C, U1347, P1066	Test cycle time is 10ms.	Type A, 1 Trips
Module DC/ DC Converter Discharging Performance		Case 1) DCDC does not stop charging when requested; Case 2) DCDC is unable to discharge the capacitor	Charging current	>10A	Diagnostic reporting is enabled when the following three steps finish: (A) LIN bus wake up Then,	= TRUE	Error count increases by 1 if an error detection occurs up to a maximum of 200.	
					(B) ESCM wake up delay Then, (C) Fault maturity delay	> 0.50 sec > 15.00 sec	decreases by 2 if no error detection occurs up to a minimum	
					expires, and the next valid LIN frame has been received; or whenever fault state from ESCM changes its value		of 0. Fault is set when error count = 200. (500ms fault	
					Afterwards, this diagnostic runs when the following conditions are met:		maturity) Fault is removed when error count = 0.	
					DCDC disabled OR DCDC discharging	= TRUE = TRUE	(1 sec healing time)	

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
			DCDC is unable to discharge the capacitor: Capacitor voltage decrease rate	< 6 mv/second in first 15 sec discharging time	Diagnostic reporting is enabled when the following three steps finish: (A) LIN bus wake up Then, (B) ESCM wake up delay Then, (C) Fault maturity delay expires, and the next valid LIN frame has been received; or whenever fault state from ESCM changes its value Afterwards, this diagnostic runs when the following conditions are met: DCDC discharging Capacitor voltage	U135C, U1347, P1066 = TRUE > 0.50 sec > 15.00 sec = TRUE > 0.5 V	Detect during first 15 seconds ot discharging. Fault is set after first detection. Fault can only be removed in the next wake up, or by LIN message.	

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
Stop-Start Capcitor Control Module DC/ DC Converter Charging Performance	P108E	Indicates that one or more of the following faults have occurs: Case 1) Charge current is too high Case 2) DCDC does not charge when requested	Charge current is too high Phase 1 charge current OR Phase 2 charge current	> 36.75A > 68.25A	Diagnostic reporting is enabled when the following three steps finish: (A) LIN bus wake up Then, (B) ESCM wake up delay Then, (C) Fault maturity delay expires, and the next valid LIN frame has been received; or whenever fault state from ESCM changes its value Afterwards, this diagnostic runs when the following conditions are met: DCDC charging	U135C, U1347, P1066 = TRUE > 0.50 sec > 2.10 sec = TRUE	Test cycle time is 10 ms. Error count increases by 10 if an error detection occurs up to a maximum of 100. Error count decreases by 1 if no error detection occurs up to a minimum of 0. Fault is set when error count = 100. (100 ms fault maturity) Fault is removed when error count = 0. (1 sec healing time)	Type A, 1 Trips
			DCDC does not charge when requested: ***********************************	< 15 Amps	No active DTCs Diagnostic reporting is enabled when the following three steps finish: (A) LIN bus wake up Then, (B) ESCM wake up delay	U135C, U1347, P1066 = TRUE > 0.50 Sec	Detection starts after 500 ms charge. Test cycle time is 100 ms. Error count increases by 1 if an error detection occurs up to a maximum of 20.	

Component/ System	Fault Code	Monitor Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Time Required	MIL Illum.
			Condtion (II) if DCDC is charging with full current AND capacitor voltage <= 4 V		Then, (C) Fault maturity delay expires, and the next valid LIN frame has been received.	> 2.10 sec	Error count decreases by 1 if no error detection occurs up to a minimum of 0.	
			Charge current	< 30 Amps	Note: After intial time delay, diagnostic runs if the following conditions satisfy:		Fault is set when error count = 20. Fault is removed when error count	
					DCDC charging	= TRUE	= 0.	
					DCDC charging time	>= 500 ms

16 OBDG03 OBD Coolant Enable Criteria (OBD Coolant Enable Criteria)

OBD Coolant enable

Starting in 11.15A software GM has created a coordinated signal within the ECM that serves as a master enable for diagnostics/controls that use coolant as an enable condition. Controls and diagnostics may choose to enable prior to this calculated signal, but calibrating beyond the OBD limit will not function because of this signal. This enable condition is also put on the CAN bus for other modules to consume as well.

KeTHMG_b_elecstatequipd = o for this application

For mechanical thermostat applications (KeTHMG_b_elecstatequipd = 0)

OBD Coolant Enable Temp = P0128 Primary target temp — Calibratable offset (0-32) — 1

OBD Coolant Enable Temp = 69.5 - 0.0 - 1

OBD Coolant Enable Temp = 68.5

For E-stat applications (KeTHMG_b_elecstatequipd = 1)

OBD Coolant Enable Temp = Max(Min(ECT Control Temp) — Primary Warm up delta, Min primary P0128 target) — Calibratable offset (0-32)

|_ 1

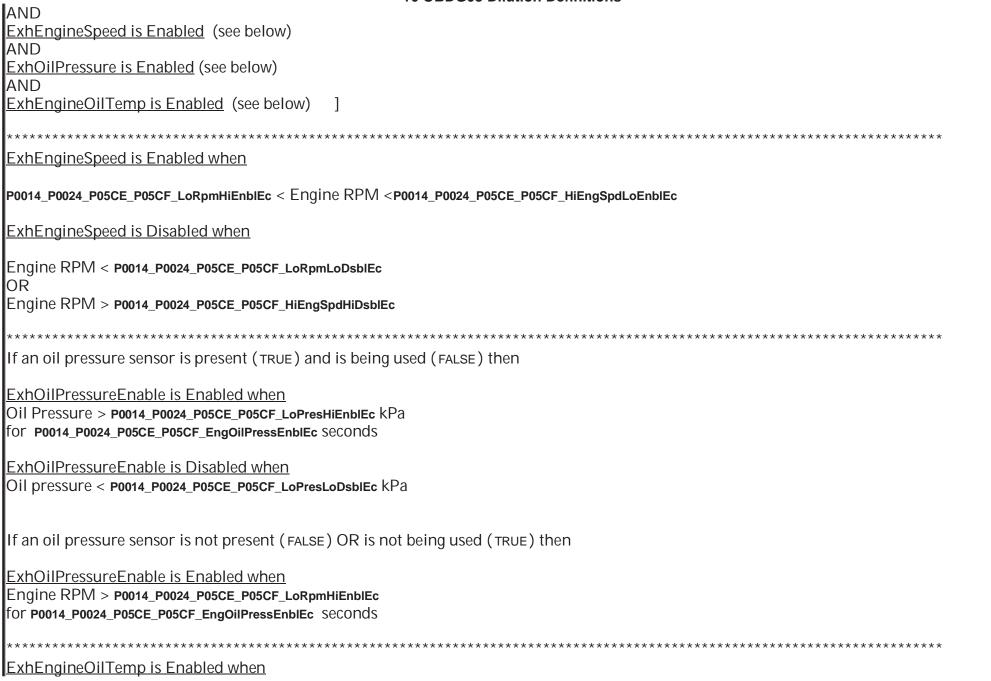

OBD Coolant Enable Temp = Max(Min(KaTHMC_T_TMS_EngCoolReq) - KaECTR_T_CTR_WrmUpDeltaTemp[0],

KaECTR_T_CTR_WrmUpTargetMin[0]) - KeECTR_T_CTR_GlbIMinOffst – 1

OBD Coolant Enable Temp = Max(90.5 - 19.0, 69.5) - 0.0 - 1

OBD Coolant Enable Temp = 70.5

-35.00 < Engine Oil Temp < 135.00 deg C
IntEngineOilTemp is Disabled when
Engine Oil Temp < -38.00 deg C
OR
Engine Oil Temp > 140.00 deg C
ReducedEngineCapacityMode_Enable
REDUCED CAPACITY CONTROL ENABLE CONDITIONS:
Conditions below must be met for >= 0.3 seconds before cylinder deactivation will begin in regular mode
Neutral Idle Mode (NI) operational checks:
Allowed in NI (FALSE)
Time NI mode shall be active >= 1.0 seconds
Vehicle Speed for NI
  < 0.0 mph to Enter
  > 0.0 mph to Exit
PRNDL position in NI = False
                              VCE_PRNDL_NI_Disables (For details see Supporting Tables)
Engine RPM lower limit for NI > 475 rpm
Transmission gear for NI = FALSE VCE_TransGear_DisablesNI(For details see Supporting Tables)
Torque based AFM entry conditions: NI Mode Active
Indicated Torque < VCE_NormalMode_MaxTorque_Gr5 minus 10.0 Nm
  (Function of Gear: VCE NormalMode MaxTorque Gr1 - Gr8, for details see Supporting Tables)
Normal Mode operational checks:
Engine running (based on engine off time)
  Maximum of 30.0 or > VCE_StartUpDelayTime seconds (For details see Supporting Tables)
Engine RPM
  > VCE_EngineRPM_LowerLmt + 50 RPM AND
  < VCE_EngineRPM_UpperLmt - 200 RPM (For details see Supporting Tables)
```

Vehicle Speed (in Gear) >= 11.2 mph

Engine RPM PRNDL Feature is TRUE (When TRUE, will enable AFM only if transmission is not in a defaulted state)

Engine coolant (deac) >= 40 and <= 241 deg C

Ignition voltage >= 11.0 volts

Engine Oil Temperature >= 20 and <= 128 deg C

Engine Oil Pressure >= 200 and <= 780 KPa

Oil pump intrusive test = FALSE (refer to P06DD and P06DE)

Oil aeration present: Aeration enabled by engine RPM > 3,100 for 10 second(s), disabled by engine RPM < 3,000 for 50 second(s)

Catalyst Warmup Enabled= FALSE

POPD: Not active

Deceleration Fuel Cut Off: Not active

Fuel shut off (FSO) delay: Not active >= 3 second(s)

Green Engine mode: Not active

Pedal Position < 48 pct

Brake booster vacuum >= 0 KPa

Transmission gear = FALSE vce_TransGear_Disables(For details see Supporting Tables)

Gear Shift: not currently in progress

4WD State: not = 4 low range

Time since last AFM mode event >= 3 second(s)

After exiting AFM mode for max time, must be in all cylinder mode for >= 60 second(s)

Tip in Bump: Not active

AFM is disabled at high percent ethanol: Ethanol concentration > 95 % disables AFM. Once disabled, ethanol concentration must be < 90 % to

re-enable

If feature is enabled, AFM is allowed only when percent ethanol learn is not in progress: Feature is FALSE

AFIM diagnostic status: Not active

A/C clutch transition: Not currently in progress ETC power management mode: Not active

Heater performance: Not in heater perforamance mode

Torque based AFM entry conditions:

ECO Mode Active: Indicated Torque < vCE_ECOMode_MaxTorque_Gr5 minus vCE_ECOMode_EnableTorqueHyst

(Function of Gear: VCE_ECOMode_MaxTorque_Gr1 - Gr8, For details see Supporting Tables)

Normal Mode: Indicated Torque < VCE_NormalMode_MaxTorque_Gr5 minus VCE_NormalMode_EnableTorqueHyst (Function of Gear: VCE_NormalMode_MaxTorque_Gr1 - Gr8, For details see Supporting Tables)

IF DEACTIVATED, ANY OF THE CONDITIONS BELOW WILL FORCE CYLINDER REACTIVATION:

If deactivation mode is active for >= 480 seconds

then reactivation will occur if: >= 600 seconds Deac mode active or Delta vacuum > 5 or < -5kPa Vehicle Speed for NI exit < oKph ETC Power management mode: Active Converter overtemp protect: Active Hot coolant mode: Active Engine running = False Engine overspeed protection: Active Engine metal overtemp protect: Active Cat. temp low: Active Four Wheel Drive: In low range Engine misfire: Detected Heater performance: Active POPD Intrusive tests: Active (see P2270-P2273, P013A-P014B) Torque based AFM exit conditions: ECO Mode Active: Indicated Torque < vCE_ECOMode_MaxTorque_Gr5 (Function of Gear: VCE ECOMode MaxTorque Gr1 - Gr8, For details see Supporting Tables) Normal Mode: Indicated Torque < vCE_NormalMode_MaxTorque_Gr5 (Function of Gear: VCE NormalMode MaxTorque Gr1 - Gr8, For details see Supporting Tables) Engine Vacuum: vce_MinVacReducedTorgMode (For details see Supporting Tables) Ignition voltage < 11 volts Engine coolant < 36 or > 245 Deg C Vehicle speed < 6.2 mph Brake booster vacuum < o kPa Engine oil temperature < 18 or > 130 Deg C Pedal Position > 50% Piston Protection: Active No active DTC's for control enable: Fault Bundles: Catalyst Warmup Enabled EngOilPressureSensorFA EnginePowerLimited

16 OBDG03 DFCO Conditions (DFCO Conditions)

DFCO Enable Conditions

COOLANT ENABLE CRITERIA

Coolant temperature < **DFCO_CoolEnblHi_Temp** °C See Supporting Table

RUN TIME ENEBALE CRIETRIA

Engine run time > DFCO_DelayAfterStart_Time seconds See Supporting Table

ENGINE SPEED ENABLE CRITERIA

TOROUF CONVERETR CLUTCH UNLOCK

POPD OFF:

- i) enabled when engine speed > (2,500.0 + supporting table value DFCO_EngSpdEnblOfst)
- ii) once enabled continue to be enabled until engine speed < (1,400.0 + supporting table value DFCO_EngSpdEnblOfst)

POPD ON:

- i) enabled when engine speed > (2,500.0 + supporting table value **DFCO_EngSpdEnblOfst**)
- ii) once enabled continue to be enabled until engine speed < (1,400.0 + supporting table value DFCO_EngSpdEnblOfst)

TORQUE CONVERETR CLUTCH LOCK

POPD OFF:

- i) enabled when engine speed > (950.0 + supporting table value **DFCO_EngSpdEnblOfst**)
- ii) once enabled continue to be enabled until engine speed < (850.0 + supporting table value **DFCO_EngSpdEnblOfst**) POPD ON:
- i) enabled when engine speed > (1,000.0 + supporting table value DFCO_EngSpdEnblOfst)
- ii) once enabled continue to be enabled until engine speed < (850.0 + supporting table value DFCO_EngSpdEnblOfst)

VEHICLE SPEED CRITERIA:

- i) enabled when vehicle speed >= (DFCO_EnblHi_Vehicle_Speed)
- ii) once enabled continue to be enabled until vehicle speed < DFCO_DsblLo_Vehicle_Speed

TORQUE CRITERIA:

- I) enabled when following AND conditions satisfied
 - (a) driver raw trq delta = raw toqrue zero pedal torque <= 65,535.0
 - b) driver shaped trg delta1 = shaped immediate torque zero pedal torque <= 50.0
 - c) driver shaped trq delta2 = shaped predicted torque minimum combustion unmanaged torque = 65,535.0
 - d) driver shaped trq delta3 = shaped immediate torque minimum combustion managed torque <= 65,535.0
- ii) once enabled, disabled when following OR conditions are satisfied
 - a) driver raw trq delta1 = raw torque zero pedal torque > 5.0
 - b) driver shaped trq delta2 = zero pedal torque minimum combustion managed torque > 65,535.0

CATALYST TEMPERATURE

- i) enabled based on following AND criteria
 - a) (CatTemp < 875.0 °C and vehicle speed < 50.0 kph)
 - b) CatTemp < 975.0 °C
 - c) CatTemp >= 200.0 °C

16 OBDG03 DFCO Conditions (DFCO Conditions)

- d) CatalystWarmupEnabled = FALSE
- ii) once enabled, disabled when following OR conditions are met

OTHER CONDITIONS:

- a) Transmission is not about to unlock
- b) Engine not about to stall
- c) Transmission is not shifting if already not in DFCO
- d) POPD or EOSD
 - 1) POPD requesting DFCO or neither requesting DFCO OFF nor inhibit DFCO
 - 2) EOSD not active
- e) EVAP does not inhibit DFCO
- f) O2 response test is not inhibiting DFCO event
- g) Throttle is not in default mode

16 OBDG03 Initial Supporting Tables

Initial Supporting table - Multiple DTC Use - Block learn cells to enable Post oxygen sensor tests

Description: KaPOPD_PostCellEnbl - A table of adaptive (Block Learn) cells in which to enable the post oxygen sensor tests.

Notes: Note: When Table column headings match the calibration value below it, that individual cell is enabled.

The cell numbers in the table are defined as:

CeFADR_e_Cell00_PurgOnAirMode5 = 0,

CeFADR_e_Cell01_PurgOnAirMode4 = 1,

CeFADR_e_Cell02_PurgOnAirMode3 = 2,

CeFADR_e_Cell03_PurgOnAirMode2 = 3,

CeFADR_e_Cell04_PurgOnAirMode1 = 4,

CeFADR_e_Cell05_PurgOnAirMode0 = 5,

CeFADR_e_Cell06_PurgOnIdle = 6,

CeFADR_e_Cell07_PurgOnDecel = 7,

CeFADR_e_Cell08_PurgOffAirMode5 = 8,

CeFADR_e_Cell09_PurgOffAirMode4 = 9,

CeFADR_e_Cell10_PurgOffAirMode3 = 10,

CeFADR_e_Cell11_PurgOffAirMode2 = 11,

CeFADR e Cell12 PurgOffAirMode1 = 12,

CeFADR_e_Cell13_PurgOffAirMode0 = 13,

CeFADR_e_Cell14_PurgOffIdle = 14,

CeFADR e Cell15 PurgOffDecel = 15

Initial Supporting table - ConsecSCD_Decel

Description: Mulitplier to medres decel to account for different pattern of the second cylinder of consecutive misfire. Multipliers are a function of engine rpm and % engine Load.

Notes: Used for P0300 - P0308, Cal Name: KtMSFD_K_dt_MEDRES_Consec

Initial Supporting table - IdleSCD_Decel

Description: Crankshaft decel threshold while in SCD mode. SCD mode uses smaller windows near TDC. Thresholds are a function of rpm and % engine Load.

Notes: Used for P0300-P0308. Cal Name: KtMISF_dt_SCD_ldleMode

Note: Misfire's Load term is %, but not PID\$04. PID\$04 is not robust to temperature and alititude shifts. (especially decel and jerk thresholds since they track actual air trapped in cylinder)

Initial Supporting table - P0325_P0330_OpenMethod_2

Description: Defines which Knock Open Circuit Diagnostic method to use.

Notes: Used for P0325 and P0330. Cal name: KaKNKD_e_OpenMethod. x-axis = Engine Speed Index, 500 to 8500 (RPM) by 500 rpm increments.

Selects 1 of 3 available methods: "20kHz Method", "Normal Noise Method," or "None" (note: "None" = disabled at that rpm). The mode chosen dictates which set of threshold tables are used. Typically, either: A) the 20 kHz Method is used for all RPM or B) the 20 kHz Method is used for low/medium RPM and the Normal Noise Method is used for high RPM.

Initial Supporting table - P0326_P0331_AbnormalNoise_CylsEnabled

Description: Specifies which cylinders will be used for the Abnormal Noise portion of the performance diagnostics (1 = cylinder used, 0 = cylinder not used)

Notes: Used for P0324, P0326 and P0331. Cal name: KaKNKD_b_PerfAbnIncludeCyl. x-axis = Cylinder number in firing order (i.e. Cyl 0 = first cylinder in firing order, Cyl 1 = second cylinder in firing order....)

A cal value = 1 specifies the cylinder is used for the Abnormal Noise diagnostic. A cal value = 0 specifies the cylinder is not used. Only the first four values in the table are relavent for a four-cylinder engine and only the first six values in the table are relavent for a six-cylinder engine.

Typically, all cylinders are used. Cylinders are only excluded if the signal from that cylinder is weak and there is no separation between normal and faulted conditions (can occur if the sensor location results in poor signal-to-noise ratio for a given cylinder).

Initial Supporting table - P06B6_P06B7_OpenTestCktThrshMax

Description: Knock Open Circuit Minimum Threshold for Internal Circuit Diagnostic. Used only when the 20 kHz method is being used (see "OpenMethod" description). The Open Test Circuit ensures that the internal circuit used to generate the 20 kHz signal for the Open Circuit diags (P0325, P0330) is within range.

Notes: Used for P0325 and P0330. Cal name: KtKNKD_k_OpenTestCktMax. x-axis = Engine Speed (RPM).

Diagnostic fails when the filtered diagnostic output is between the OpenTestCktThrshMin and OpenTestCktThrshMax:

i.e. KtKNKD_k_OpenTestCktMin < VaKNKD_k_OpenTestCktIntFilter < KtKNKD_k_OpenTestCktMax

Initial Supporting table - Closed Loop Enable Clarification - KcFCLP_Cnt_O2RdyCyclesThrsh							
Description: Number of post catalyst oxygen sensor samples which must be outside not ready window before post oxygen sensor is READY.							
Notes: Time (events * 12.5 milliseconds)							
y/x	1						
1	80						

Initial Supporting table - Closed Loop Enable Clarification - KcFULC_O2_SensorReadyEvents							
Description: Number of times an oxygen sensor value must be in range before declaring it ready							
Notes: Time (events * 12.5 milliseconds)							
1	2						

Initial Supporting table - Closed Loop Enable Clarification - KeFCLP_Pct_CatAccuSlphrPostDsbl							
Description: Sulphur percent threshold above which post integral learning is disabled if the threshold criteria KaFCLP_U_SlphrIntglOfst_Thrsh is also met.							
Notes: Percent							
1							
1	255						

Initial Supporting table - Closed Loop Enable Clarification - KeFCLP_T_IntegrationCatalystMax							
Description: Maximum allowed estimated catalytic converter temperature for post O2 integral terms to be updated.							
Notes: Modeled catalyst Temperature in Celcius	Notes: Modeled catalyst Temperature in Celcius						
x 1							
1	1,000						

Description: Minimum allowed estimated catalytic converter temperature to begin using post O2 integration correction terms. Converter temperature must remain above this threshold to ramp-in the post O2 integration adjustments. Once the ramp-in has started, a converter temperature below this threshold will freeze the ramp-in multiplier. Post O2 integration will not be allowed below this converter temperature

Notes: Modeled catalyst Temperature in Celcius

Initial Supporting table - P050D_P1400_CatalystLightOffExtendedEngineRunTimeExit

Description: Exit Catalyst Warm-up mode if Engine Run Time is greater than this value. This table is based on percent ethanol (x-axis) and catmon's NormRatio_EWMA value (y-axis). The NormRatio_EWMA value determines the state of the catalyst. Typically, NormRatio_EWMA values below 0.35 (0 is bad and 1 is good) represent catalysts that have degraded. The emission performance of these degraded catalysts can be improved by extending catalyst light off of GetE85R_Pct_FFS_CompAtEngFloat.

Notes: KtCSEC_t_ExtendedEngineExit. Used for both P050D and P1400.

Initial Supporting table - P1400_ColdStartDiagnosticDelayBasedOnEngineRunTime

Description: Quality weight-based on engine run time. This allows adjustment of the weighting factors at various engine run times in order to prevent the updating of the cumulative quality timer or to change the value of the average qualified residual energy calculation to prevent false Fails of the diagnostic under circumstances inappropriate to update the calculation of the average qualified residual value.

Notes: KtCSED_K_TimeWght - This is used for P1400.

1	0 3 3 4 5 10 15 20 30												

Initial Supporting table - P1400_EngineSpeedResidual_Table

Description: This 1x17 table of engine exhaust flow values is used to calculate both the desired and the actual engine exhaust flow based on desired and actual engine speed. The desired engine exhaust flow is gathered from the desired engine speed (VeSPDR_n_EngDsrd). The value used for the actual engine exhaust flow is based on the actual engine RPM value.

Notes: KtCSED_dm_Exh - This is used for P1400

Initial Supporting table - P1400_SparkResidual_Table

Description: Predicted engine-out energy potential based on either the desired cold start spark advance value or the actual spark advance value. ExhEngyPerUnitMass used to calculate both desired exhaust energy and actual energy. The desired and actual exhaust energy per unit mass values are used in part to calculate the desired exhaust energy per unit time and actual exhaust energy per unit time. Both desired and actual go into the residual exhaust energy per unit time calculation.

Notes: KtCSED_E_ExhEngyPerUnitMass

Unique Supporting table - P0806 ResidualErrEnableHigh Table

Description: Represents the upper threshold of a deadband where the diagnostic will be inhibited to prevent false fails due to clutch slip that can falsely indicate a valid in-gear N/TOS ratio. The lower threshold of the deadband is represented by the table "P0806 ResidualErrEnableLow Table". A lower threshold value that is greater than or equal to the upper threshold for the same gear is an indication that this portion of the diagnostic's enable critera is ignored in that gear. Conversely if the lower threshold value is at or near 0% and the upper threshold for the same gear is at or near 100%, then diagnosis is not enabled in that gear.

Notes: DTCs: P0806; Calibration Name: KaMTCI_Pct_ResidErrCalcEnbHigh; Axis identifies Gear, where "0" - "5" is gear 1 - 6, respectively; "6" is reverse or 7th gear, if equipped, and "7" is neutral. Calibration value units are Percent Clutch Pedal Position (%), where 0% = bottom of pedal travel.

	y/x	0	1	2	3	4	5	6	7

Unique Supporting table - P0420_P0430_CatmonMinAirflowForWarmCatalystDetermination

Description: This is a 1x3 table with the axis being engine coolant temperature. The implementation of this cal value as a table also included some changes to the way that the WarmedUpEvents counter increments and resets. To summarize, whenever WarmedUpEvents resets to 0 (this could be either at startup, if the closed throttle time exceeds a cal value, or if the predicted exhaust temperature falls below the ExhWarmMin cal value), the appropriate MinAirflowToWrmupCat value is chosen from the table based on engine coolant at the time the WarmedUpEvents counter reset to 0. This cal value is used along with the min exhaust temp to increment the WarmedUpEvents counter.

Notes: KtCATD_dm_MinAirFlowToWrmCat - Used for P0420 and P0430. Axis is the engine coolant and the output is the minimum airflow required to warmup the catalyst.

y/x	0	45	90
1	10	9	8

Unique Supporting table - P0420_P0430_CatmonMinEngineRunTimeToEnable

Description: This cal value is a 1x5 array of minimum engine run time values based on powerup coolant temperatures. When the appropriate required minimum engine run time value is chosen based on the coolant temperature at powerup, this value is the minimum time from engine start before stabilized conditions are met. Used in determining if a ValidIdleIsMet condition exists.

Notes: KtCATD_t_EngRunTimeMin - Used for P0420 and P0430. Axis is the coolant and the output is the min engine run time

ľ	y/x	40	50	60	70	80
	1	30	30	30	30	30

Unique Supporting table - P00B6_Fail if power up ECT exceeds RCT by these values

Description: KtTHMD_T_DCRD_FastFailTempDiff

Notes: X axis is IAT Temperature at Power up (° C), Z axis is the Fast Failure temp difference (° C) The 17 X-axis breakpoints for the table below are (L to R) -40, -28, -16, -4, 8, 20, 32, 44, 56, 68, 80, 92, 104, 116, 128, 140 and 152. Note: Remove for applications with single coolant sensor

ľ	y/x	-40	-28	-16	-4	8	20	32	44	56	68	80	92	104	116	128	140	152

- Gyotom		2 ccs., p.i.e.i	- Control de	Talluc .	16. Battery Voltage 17. Fuel flow rate (See Supporting Tables tab) 18. Fuel Pressure Control System	11V<=voltage=<32V > 0.047 g/s AND <= Max allowed fuel flow rate as a function of desired rail pressure & Vbatt (Typical values in the range of 11 to 50 g/s) Is not responding to an over-pressurization due to pressure build during DFCO or a decreasing desired pressure command.		
Control Module Communication Bus "A" Off	U0073	Detects that a CAN serial data bus shorted condition has occurred to force the CAN device driver to enter a bus-off state	Bus Status	Off	Power mode	Run/Crank	5 failures out of 5 samples (5 seconds)	DTC Type B 2 trips
Lost Communication With ECM/PCM "A"	U0100	Detects that CAN serial data communication has been lost with the ECM	Message \$0C9	Undetected	Power mode Ignition Run/Crank Voltage U0073	Run/Crank 11V <voltage<32v active<="" not="" td=""><td>12 failures out of 12 samples (12 seconds)</td><td>DTC Type B 2 trips</td></voltage<32v>	12 failures out of 12 samples (12 seconds)	DTC Type B 2 trips

16 OBDG03 Diagnostic Supporting Calculations - FPCM

P2635 - Calculation of fault thresholds

Calculation of Fault Thresholds:

Givens: Measured values observed at a typical operating point for an 80mph roadload -Engine rpm = 1900 rev/min, Instantaneous Fuel Flow = 1.265 g/s, Fuel Line Pressure = 304 kPa (gage)

Example: Pressure Error Fault Threshold Low at chosen operating point:

Min Injector Flow [g/s] = Minimum Injector Pulse Width [ms] * Injector Slope[mg/ms/inj] * Number of Fuel Injectors / 2 [inj/rev] * Engine Speed [rev/min] * 1/60 [min/s] * 1/1000 [g/mg]

Min Injector Flow = 0.25 * 1.565918* 4 / 2 * 1900 / 60 / 1000 = 0.0247 g/s

Max Overfueling Error [] = (Instantaneous Injector Flow [g/s] / Min Injector Flow [g/s]) = 1.265 (g/s) / 0.0247 (g/s) = 51.2147 / 100 (decimal conversion) = 0.512147 (51%)

The overfuelling fuel flow error is limited to the range of between 105% and 115% overfuelling depending on the actual fuel flow. The MaxOverfuelingError calculated above is **outside the scaling range**; therefore, the overperformance fault threshold for this operating point is then calculated using the limited value (105% or 1.05) as follows:

Pressure Error Fault Threshold Low[kPa]

```
= Injector Pressure Drop [kPa] *(1-(Max Overfueling Error)^2)
= 304 * (1-(1.05 * 1.05))
= -31.16 kPa
```

Example: Pressure Error Fault Threshold High at same given operating point as the above example:

Max Injector Flow[g/s] = Injector Slope[mg/ms/inj] * Number of Fuel Injectors [inj] * 1/1000 [g/mg] * 1000 [ms/s]

Max Injector Flow[g/s] = 1.565918 * 4 * 1/1000 * 1000 = 6.26 g/s

Max Underfueling Error [] = (Instantaneous Injector Flow [g/s] / Max Injector Flow [g/s]) = 1.265 (g/s) / 6.26 (g/s) = 0.202 (20%)

The underfuelling fuel flow error is limited to the range between 85% and 95% overfuelling depending on the actual fuel flow. The MaxUnderfuelingError calculated above falls **below limited range**, therefore it is **limited** to;

Max Underfueling Error [] = 0.85

The underperformance fault threshold for this operating point is then calculated as:

Pressure Error Fault Threshold High [kPa]
